

Mulwarrie Gold Project, WA – Exploration Update

Mulwarrie extended a further 100m down-plunge with new high-grade hits – new footwall lode discovered

- Mulwarrie continues to deliver **high-grade assay results well beyond the existing resource** (78koz @ 2.8g/t Au), reinforcing the growth potential at the project.
- Significant new intercepts from this drilling include:
 - **9m @ 4.9g/t Au from 253m** in **MWEX036**, 50m down-plunge of MWEX016 (5m @ 16.1 g/t Au).
 - **8m @ 4.7g/t Au from 33m** in **MWEX069**, in-filling historical drilling near surface.
- A **new lode** has also been discovered 150m into the footwall of the main Mulwarrie mineralisation, with MWEX072 intersecting 3m @ 1.7g/t Au from 52m.
- This is the **third new lode discovered** by Gorilla in this maiden drilling program, highlighting the **significant gold endowment** of the Mulwarrie system, which comprises **multiple stacked lodes** commencing from **surface** and extending over a **width of 200-300m** and total **2.5km strike** extent.
- Drilling results from the remaining 15-20 holes of the maiden Mulwarrie program will be received over the coming weeks. This drilling targeted further **depth extensions** to the mineralisation.
- **GG8 is on track to deliver an updated Mineral Resource Estimate (MRE) at Mulwarrie in Q3 2025** while also continuing to focus on discovering significant new mineralisation.

Gorilla Gold Mines Ltd ('**Gorilla**', '**GG8**' or '**the Company**'), is pleased to announce further drilling results from recent diamond drilling at its 100%-owned Mulwarrie Gold Project, located 60km from its Comet Vale Project and close to multiple operating gold processing facilities just north of Kalgoorlie in Western Australia's Goldfields.

This release reports significant new high-grade assay results from drilling targeting down-dip extensions as well as shallow in-fill of the known mineralisation at the Mulwarrie Project.

Charles Hughes, Chief Executive Officer commented:

"Mulwarrie is continuing to deliver impressive results on several fronts, confirming its potential as a large, high-grade, multi-lode gold deposit that starts from surface with mineralisation now intersected in multiple lodes over a zone greater than 200m wide, well beyond the current resource up to 400 metres below surface."

“Gorilla is building towards a significant upgrade to the existing resource at this project, with these results contributing towards our targeted Q3 MRE update.

“The results reported in this announcement extend the high-grade mineralisation down-plunge by 100m in MWEX036 and MWEX034 at Mulwarrie Central, while also returning excellent shallow in-fill intercepts in MWEX069, firming up the shallow portions of the deposit.

“Importantly, we have also intersected an additional parallel lode from shallow drilling in MWEX072, which is the third new lode discovered by Gorilla in this maiden drilling program.

“This demonstrates the growing scale and continuity of the Mulwarrie gold system, with drilling defining multiple high-grade lodges from surface to a depth of 400m and extending over a strike length of more than 2km.

“Part of this upside will be captured in the impending Q3 MRE update, although it’s fair to say we see great potential for further growth beyond this in the next round of drilling, particularly along the broader 2.5km strike extent up to Mulwarrie North.

“We still have a number of diamond drill hole samples at the labs from extensional drilling at depth that will be returned prior to the MRE upgrade, and we look forward to reporting these as they come to hand.

“At the same time, we are rapidly advancing our exploration and growth strategy at the Comet Vale Project, with 4-5 rigs expected to be operating at Comet Vale over the next few months.

“Investors can look forward to a period of intense activity and news-flow as we delineate the full extent of the high-grade Lakeview discovery at Comet Vale and set the foundations for a maiden MRE in Q4 this year, while also reporting the remaining results from Mulwarrie and finalising the MRE update this quarter.”

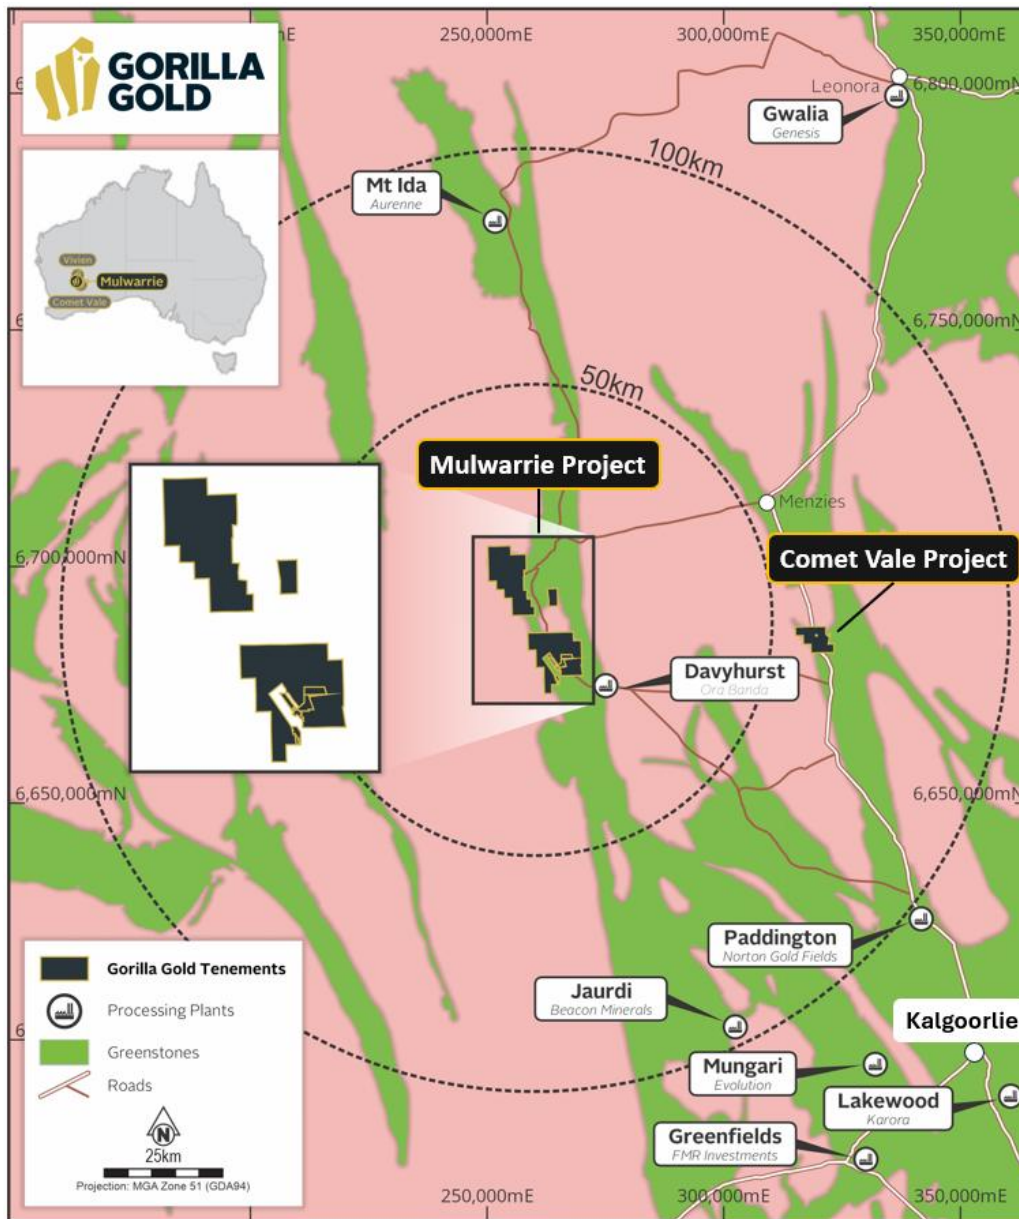

Figure 1 Location of Mulwarrie

Growth and Exploration activities at Mulwarrie

The main mineralisation at Mulwarrie was discovered in 2017, with modest open pit production occurring before then. Prior to this 2017 discovery, the project had fractured ownership and after the discovery, the project was tenure constrained and caught up in M&A activity. When Gorilla acquired this project in November 2024 it further consolidated tenure in the area to unlock growth opportunities for the project. A Mineral Resources Estimate ('MRE') of 78koz @ 2.8 g/t Au (Reporting on Genesis Minerals Mulwarrie Project, 18 Nov 2024), exists at the project which Gorilla is aiming to increase in both the tonnes and grade.

Mulwarrie lies within granted mining leases, is adjacent to the Riverina-Davyhurst haul road, situated in a region with multiple operational gold mills within a 100km radius of the Project area.

At Mulwarrie a major North-West trending, steeply dipping, fault system is developed in mafic and intermediate lithologies with mineralisation associated with this structural system and the development of quartz veining, pyrrhotite and pyrite sulphides and biotite alteration, often at the margins of intermediate porphyries.

Drilling activities reported in this release are an update on exploration and growth drilling from Gorilla's rapid resource growth campaign at Mulwarrie.

Significant gold intercepts (Table 1, Figures 2 & 3), have been received from this round of drilling, extending mineralisation in the Mulwarrie Central area down plunge by 100m (MWEX036, MWEX034), infilling mineralisation near surface (MWEX069), and intercepting a new lode in the footwall of the main zone (MWEX072).

Hole ID	From	To	interval	Au g/t
MWEX036	253	262	9	4.9
MWEX034	333.6	334.6	1	8.9
MWEX069	33	41	8	4.7
MWEX072	52	55	3	1.7

Next steps at Mulwarrie

Gorilla is currently running an MRE update for the Mulwarrie Project, which is expected to be announced to the market in the coming weeks.

The remainder of the drill holes from GG8's maiden Mulwarrie drilling program are with the lab and results will be returned from these remaining 15-20 holes over the coming weeks prior to the holes being included in the MRE update.

Planning and permitting is ongoing for further drilling programs post the MRE update in Q3.

This announcement has been authorised and approved for release by the Board.

Competent Person's Statement:

The information in this announcement relates to exploration results for the Mulwarrie Project which Mr. Charles Hughes has reviewed and approves. Mr. Hughes, who is an employee of Gorilla Gold Mines Ltd, a professional geoscientist and a Member of the Australian Institute of Geoscientists. Mr. Hughes has sufficient experience relevant to the style of mineralisation and type of deposits under consideration, and to the activities which have been undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves. Mr. Hughes consents to the inclusion in this announcement of the matters based on this information in the form and context in which it appears.

Specific exploration results referred to in this announcement were originally reported in the following Company announcements in accordance with ASX Listing Rule 5.7:

Title	Date
Update For Comet Vale and Mulwarrie	2 July 2025
High Grade Diamond Drill results from Mulwarrie	12 June 2025
Mulwarrie Drilling Update	30 May 2025
Mulwarrie Update	4 April 2025
Maiden Drilling Results from Mulwarrie	21 March 2025
Reporting on Genesis Minerals Mulwarrie Project	18 November 2024
Acquisition of Mulwarrie Project from Genesis Minerals	18 November 2024
High grade diamond drilling results at Mulwarrie confirm lode structures and pave way for resource upgrade	18 March 2019

The Company confirms that it is not aware of any information or data that materially affects the information included in the said original announcements and the form and context in which the Competent Persons' findings are presented have not materially modified from the original market announcements.

The current Mineral Resource Statement for the Mulwarrie Project:

Mulwarrie Mineral Resource Estimate Summary (0.5g/t cut-off)

Category	Tonnage (Mt)	Au Grade (g/t)	Au Ounces
Inferred	0.88	2.8	78,700
Total	0.88	2.8	78,700

The Company confirms that it is not aware of any new information or data that materially affects the information as previously released on 18 November 2024 and all material assumptions and technical parameters underpinning the estimate continue to apply and have not materially changed.

APPENDIX 1 NEW COLLAR INFORMATION MULWARRIE

Prospect	Hole ID	Depth	Hole Type	Grid	East	North	RL	dip	azi
Mulwarrie	MWEX036	426.2	RCDD	GDA94Z51	265527	6678186	483	72	234

APPENDIX 3 JORC TABLES

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Comments
Sampling techniques	<ul style="list-style-type: none"> Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. 	<ul style="list-style-type: none"> RC drilling - samples collected as 4m composites and in areas where interesting lithology, alteration, mineralisation or veining was encountered, 1m splits were taken. Composite samples are collected from sample piles, 1m splits are taken for every metre from the cyclone with duplicate samples taken at the instruction of the field geologist from the second chute on the cone. DD drilling has samples collected as half core in intervals between 0.3-1m based on lithology. Samples collected by GG8 field crew and submitted to ALS Laboratory in Kalgoorlie, WA. All samples are considered to be representative for the manner in which they are used. The samples were analysed using the photon assay method which uses a 0.5kg sample and requires minimal handling. The samples are riffle split at the lab and crushed to 80% passing 2mm to ensure homogeneity as uniform sample distribution is important to a quality analysis.
Drilling techniques	<ul style="list-style-type: none"> Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). 	<ul style="list-style-type: none"> RC drilling was completed by several contractors using multiple modern RC rigs capable of significant drill depths. RC drilling uses a standard 5.5in bit and an auxiliary booster capable of 900psi, sufficient to keep sample dry at most depths. DD drilling was completed by contractors using multiple modern DD rigs. All drill rigs utilised by GG8 are industry best standard.
Drill sample recovery	<ul style="list-style-type: none"> Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<ul style="list-style-type: none"> RC sample recovery was qualitatively assessed by the field geologists. Good recoveries were had. DD recovery measured actual core length between drillers blocks to the nearest cm. Sample weights are recorded by the laboratory and average 3kg. Sample depths were cross-checked regularly. The cyclone was regularly cleaned to ensure no material build up and sample material was checked for any potential downhole contamination. The drilling sample recoveries/quality are acceptable and are appropriately representative for the style of mineralisation. no obvious sample recovery biases or biases related to loss or gain of fines have been identified.

For personal use only

Logging	<ul style="list-style-type: none"> Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. 	<ul style="list-style-type: none"> Logged for geology on the 1m intervals with chips washed and stored in chip trays by the geologist. Logging was inputted directly into the onsite laptops using suitable Company logging. DD core stored in trays with every metre logged. Logging is of a qualitative nature.
	<ul style="list-style-type: none"> Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. 	<ul style="list-style-type: none"> RC chips and DD were logged for lithology, colour, weathering, texture and minerals present. Structural measurements and geotechnical data were recorded on DD core
	<ul style="list-style-type: none"> The total length and percentage of the relevant intersections logged. 	<ul style="list-style-type: none"> N/A
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> If core, whether cut or sawn and whether quarter, half or all cores taken. 	<ul style="list-style-type: none"> Core is sawn with half cores taken for assay
	<ul style="list-style-type: none"> If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. 	<ul style="list-style-type: none"> RC drilling single 1 metre splits were automatically taken at the time of drilling by a cone splitter attached to the cyclone. 4m composite samples were taken from sample piles. Samples have been dry. Samples are then riffle split at the lab into 0.5kg samples and crushed to 2mm prior to photon assay with a particle size distribution test to ensure 80% passing the 2mm threshold.
	<ul style="list-style-type: none"> For all sample types, the nature, quality and appropriateness of the sample preparation technique. 	<ul style="list-style-type: none"> The technique was appropriate for the work undertaken. During RC logging samples that showed mineralisation, veining or alteration had 1m split samples collected. 1m split samples are later taken from where 4m composites show >0.2g/t gold anomalism. During DD logging any sulphide veining or alteration were sampled.
	<ul style="list-style-type: none"> Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. 	<ul style="list-style-type: none"> QAQC reference samples and duplicates were submitted by GG8. In house standards and blanks were also inserted by ALS.
	<ul style="list-style-type: none"> Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. 	<ul style="list-style-type: none"> 1m samples are automatically bagged from the cyclone, field duplicates are taken from a second shute off the splitter. DD duplicates are taken
	<ul style="list-style-type: none"> Whether sample sizes are appropriate to the grain size of the material being sampled. 	<ul style="list-style-type: none"> All RC samples are collected to approximately 1-5 kg. The sample sizes taken are appropriate relative to the style of mineralisation and analytical methods undertaken. DD sample size is appropriate
	<ul style="list-style-type: none"> The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. 	<ul style="list-style-type: none"> All samples were sent to ALS laboratory in Kalgoorlie. Photon Assay method has shown to provide quick turnaround times and high accuracy.
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. 	<ul style="list-style-type: none"> All analytical results listed are from an accredited laboratory using photon assay method with fire assay as a check method.
	<ul style="list-style-type: none"> Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established. 	<ul style="list-style-type: none"> Certified Reference Materials (CRMs) are included in each batch to ensure the reliability of the assay. These CRMs, such as OREAS254C, OREAS230, and OREAS241, are specifically chosen for photon assay to maintain quality standards and were evaluated against published certificates. The standard deviation was minimal for samples. Selected photon assays over a range of grades and from different parts of orebodies are umpire checked with Fire Assays and so far shows no material difference in reported grades.

For personal use only

Verification of sampling and assaying	<ul style="list-style-type: none"> The verification of significant intersections by either independent or alternative company personnel. 	<ul style="list-style-type: none"> External verification has not been carried out, but values were checked against logging and photographs to ensure the intersected Au values are in line with logged alteration, mineralisation or veining. Significant intercepts have been verified by the Exploration Manager, the CEO and Principal consulting geologist.
	<ul style="list-style-type: none"> The use of twinned holes 	<ul style="list-style-type: none"> No twinned holes at this stage
	<ul style="list-style-type: none"> Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. 	<ul style="list-style-type: none"> Data was captured directly into specific geological logging software. Assay files have been sent directly from the lab to database manager to avoid operator errors. All physical sampling sheets are filed and scanned electronically and submissions to the lab checked to ensure that no samples are missing or incorrect IDs.
	<ul style="list-style-type: none"> Discuss any adjustment to assay data. 	<ul style="list-style-type: none"> No adjustments were made to the assay data.
Location of data points	<ul style="list-style-type: none"> Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. 	<ul style="list-style-type: none"> Samples were located using handheld Garmin GPS, the GPS is accurate within 3-5m.
	<ul style="list-style-type: none"> Specification of the grid system used. 	<ul style="list-style-type: none"> All collar locations and maps quoted in this Report are using the GDA1994 MGA, Zone 51 coordinate system.
	<ul style="list-style-type: none"> Quality and adequacy of topographic control. 	<ul style="list-style-type: none"> Topography based on detailed topographic surveys.
Data spacing and distribution	<ul style="list-style-type: none"> Data spacing for reporting of Exploration Results. 	<ul style="list-style-type: none"> Data spacing is varied
	<ul style="list-style-type: none"> Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. 	<ul style="list-style-type: none"> N/A
	<ul style="list-style-type: none"> Whether sample compositing has been applied. 	<ul style="list-style-type: none"> Intercepts are aggregated based upon 0.5g/t Au cut off grade and 3m of dilution material.
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. 	<ul style="list-style-type: none"> The relationship between the drilling orientation and the orientation of mineralised structures is not considered to have introduced a sampling bias. Most holes have been drilled perpendicular to the main orientation of the interpreted mineralised zone.
	<ul style="list-style-type: none"> If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	<ul style="list-style-type: none"> No drilling orientation related sampling bias has been identified at the Project. Some orientation changes were made to historic holes and the main structure was intersected at the interpreted depth.
Sample security	<ul style="list-style-type: none"> The measures taken to ensure sample security. 	<ul style="list-style-type: none"> Samples were transported from the field to the lab by GG8 personnel.
Audits or reviews	<ul style="list-style-type: none"> The results of any audits or reviews of sampling techniques and data. 	<ul style="list-style-type: none"> GG8 undertakes continuous audits and reviews of all its field processes.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. 	<p>The Mulwarrie project is in the Davyhurst region of the Eastern Goldfields, Western Australia. M30/119, M30/145, E30/511, E30/512, E30/513, P30/1141, P30/1142 and P30/1143. A 2.5% NSR is payable on the first 50koz of combined gold production from M30/119 and M30/145.</p>
	<ul style="list-style-type: none"> The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	<ul style="list-style-type: none"> No known impediments exist with respect to the exploration or development of the tenement.
Exploration done by other parties	<ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. 	<ul style="list-style-type: none"> See previous announcements. Review the Bardoc/Spitfire ASX announcement 19 March 2019, HIGH-GRADE DIAMOND DRILLING RESULTS AT MULWARRIE CONFIRM LODE STRUCTURES AND PAVE WAY FOR RESOURCE UPGRADE A summary of previous exploration at Mulwarrie Gold Project is included below. The Mulwarrie District, including the Mulwarrie Project area has a recorded production of 26,344 ounces of gold from 19,728 tonnes for an average grade of 41.53 g/t Au (1903-1910). 1983 -1988 – Pancontinental Mining Limited completed gridding, geological mapping, aeromagnetic and ground surveys, IP surveys, regional soil sampling, costeaning, RAB and RC drilling. Callion, a subsidiary of the German based corporation, Thyssen Schachtbau GMBH (TSG) commenced mining at Mulwarrie Central West in November 1989, with New Holland Mining N.L. (20% interest) and H.F. Reif (6.25% interest). A total of 24,344 tonnes @ 3.88 g/t for 94.5 kg (3,037 ounces) of gold was recovered. In 1995 Consolidated Minerals had secured the tenements and in 1996 completed 34 RC holes (MWRC 601-634) for a total of 2,977 metres and to a maximum depth of 126 metres. Post 1997 and up to the date that Ethan Minerals Ltd signed option agreements with Reif and Hoppmann the latter parties conducted their own exploration programs within the Mulwarrie tenements. This work consisted of RC drilling, reconnaissance prospecting and loam sampling. In 1998 Reif and Hoppmann conducted an RC drilling program of 8 drill holes. MWRC 635 – MWRC 642 which was focused directly south of the Central Pit between 9590 North and 9620 North. The individual assay results from this program cannot be located in available reports. In 2017 Spitfire Minerals conducted drilling programs and after Bardoc took ownership conducted a resource estimation and investigated internally mining and economic studies. A pit cutback design was created.

<p>Geology</p>	<ul style="list-style-type: none"> ▪ Deposit type, geological setting and style of mineralisation. 	<ul style="list-style-type: none"> ▪ The Mulwarrie Gold Project lies within a 10km wide greenstone belt which forms the northwest extension of the Coolgardie Line. The structurally dominant north trending Mt. Ida fault lies approximately 4km east of the Mulwarrie Mining Centre. Most of the lithologies within this greenstone belt are steeply dipping and well foliated along an NNW/SSE trend. ▪ Gold mineralisation has been found in two distinct settings at Mulwarrie. Firstly, in narrow shear zones with only minor or no quartz veining, with limited calcsilicate alteration haloes and with variable, but occasionally high gold values. The zones of mineralisation may be up to 2 metres wide but are generally less than 50 cm. They are conformable to the stratigraphy and foliation. The second and most important type of gold mineralisation is associated with quite flat dipping often massive quartz reefs with strong diopside, biotite, epidote and carbonate alteration haloes where gold is also found and contributes to the overall wide mineralised intervals. ▪ Gold mineralisation at Mulwarrie is associated with flat to steep dipping quartz reefs with strong diopside, biotite, epidote and carbonate alteration haloes. Pyrrhotite and pyrite development is also strong within and adjacent to the quartz reefs. Minor amounts of chalcopyrite, galena and sphalerite are also associated with gold mineralisation. Gold is found within quartz reefs, within biotite selvages to the quartz veins and in sheared & altered country rocks. ▪ The main modelled mineralised domains have a total dimension of 1,000m (north-south), ranging between less than a metre to multiple metres over up to 150m (east-west) in multiple veins and ranging between 300m and 500m RL (AMSL). ▪ Benson (1996) interpreted the mineralised zones as being lens shaped pods and as being structurally and stratigraphically controlled with the zones commonly occurring at felsic/mafic contacts, within shear zones and at metabasalt -metadolerite contacts.
