ASX Announcement
ASX: GML

9 September 2025

GRAVITY INVERSION MODELLING ACCURATELY DELINEATES MAJOR INTRUSIONS AT KEY TARGET AREAS

FURTHER GEOCHEMICAL WORK PROVIDES ADDITIONAL EVIDENCE OF A SIGNIFICANT GOLD SYSTEM ACROSS KEY TARGET AREAS

HIGHLIGHTS

- **The geophysical and geochemical results from Gateway's three key target areas – Great Western, Mustang, and Dusk 'til Dawn – confirm the potential for the discovery of significant gold mineralisation (Figures 1 and 2).**
- **Closer spaced gravity surveying and inversion modelling of Great Western and Dusk 'til Dawn has accurately delineated intrusions proximal to surface gold mineralisation (Figures 3 and 5).**
- **Multiple intrusions modelled immediately north of Mustang (Pony, Colt and Haflinger) signify very high structural complexity – an ideal setting for gold mineralisation (Figure 7).**
- **Petrological and lithogeochemical analysis of BOH samples at Dusk 'til Dawn identified a sanukitoid intrusion (a common feature of large orogenic gold systems in the Yilgarn Craton).**
- **Drilling programs have been brought forward – 25,000m aircore program at Mustang to now commence first week of October, and diamond drilling at Dusk 'til Dawn to now commence mid-October.**
- **Gateway remains well capitalised to undertake planned 2025 and 2026 exploration, with cash and liquid ASX listed securities of approximately $12.1m, as at the end of the June quarter.**

Introduction

Gateway Mining Limited (ASX: GML) (**Gateway** or **Company**) is pleased to provide an update on its 100%-owned Yandal Gold Project in Western Australia.

Management Comment

Gateway's Executive Chairman, Mr Andrew Bray, said: "*We are continuing to build a very compelling and comprehensive exploration case for the discovery of large-scale gold mineralisation at our three key target areas – Great Western, Mustang, and Dusk 'til Dawn – on the globally significant Yandal Greenstone Belt.*

The modelling of the Great Western intrusion (Figure 3) is particularly impressive given its proximity to the recently identified surface gold anomalism (see ASX announcement 3 September 2025), which now appears to 'wrap around' the edge of this new model. The modelling also provides further confirmatory evidence that the limited historic drilling was drilled too far east to test the main target corridor.

The modelling of three intrusions at the northern convergence of the Celia and Mustang shear zones – the Pony, Colt and Haflinger intrusions – suggests a zone of very high structural complexity. Figure 2 provides a good visual representation of the extent of the structural deformation in this area, while Figure 7 shows how the shear zone appears to 'zig zag' through the intrusions. Major north-east cross-cutting features provide further complexity. An area like this is precisely the sort of geological context where you would expect to find very significant gold mineralisation. Pleasingly, we have brought forward commencement of the 25,000m aircore program which will cover these targets.

Finally, Dusk 'til Dawn continues to provide further convincing evidence that the area is host to a very substantial gold system. Recently completed petrological and lithogeochemical analysis of BOH samples has identified a sanukitoid intrusion. The Geological Society of Western Australia (GSWA) has recently provided significant

research and commentary around the importance of sanukitoid intrusions being present in large-scale Archean orogenic gold systems. While such intrusions are a common feature of large gold deposits, they are relatively rare within the Yilgarn Craton. An IP survey is nearing completion at Dusk 'til Dawn, the results of which will assist in finalisation of the upcoming diamond drilling program. We have also been able to bring forward commencement of this program, which is now scheduled to start around mid-October."

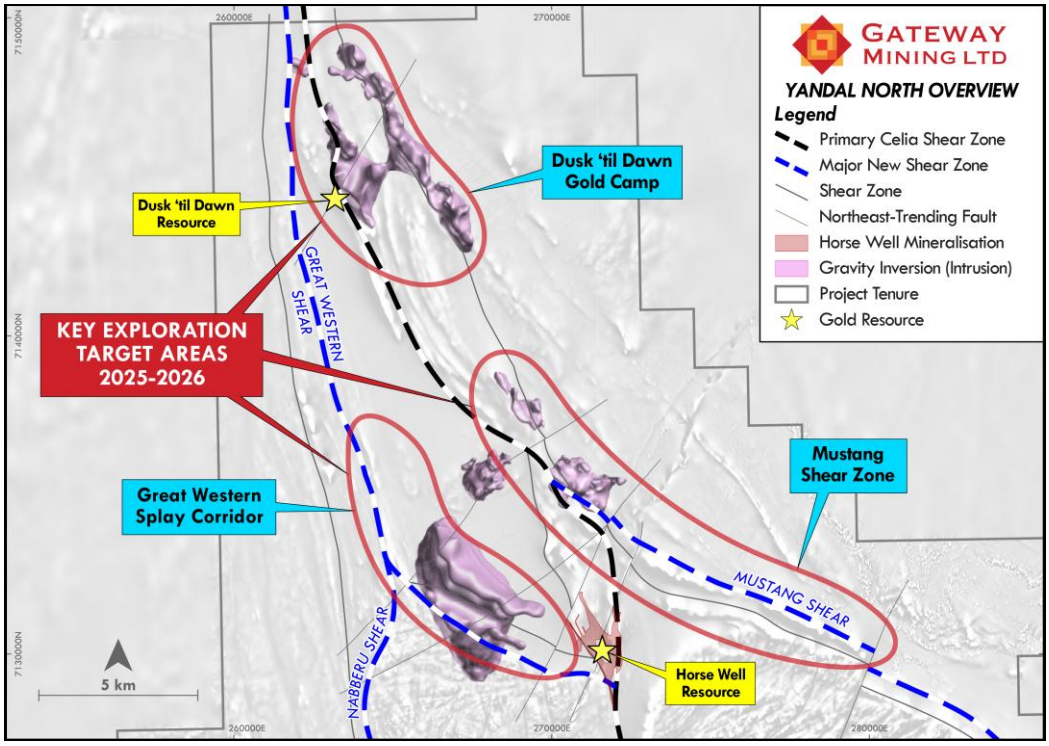

Figure 1: Modelled intrusives (light pink) in relation to the key prospect and target area with underlying greyscale 2VD magnetic image underlay.

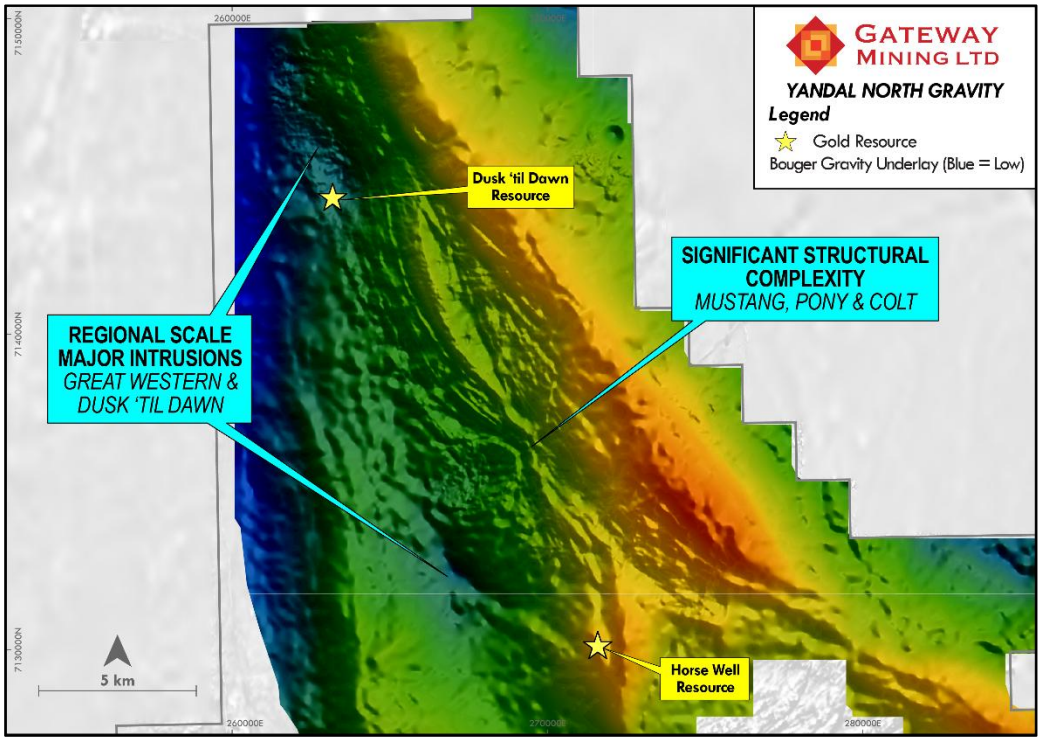

Figure 2: Gravity data showing Great Western and Dusk 'til Dawn intrusions, as well as structural complexity at Mustang.

Yandal Project, Western Australia (100% Gateway)

Gateway is pleased to announce the results from the recently completed high resolution (50 metre spaced) ground gravity survey that was completed across the three key target areas of the Yandal Project – Great Western, Mustang, and Dusk 'til Dawn.

Gravity inversion modelling was undertaken by Terra Resources, with the results from this work delineating key structural trends adjacent to several gravity low. The higher resolution data has successfully modelled these interpreted intrusive units to within 100 metres of surface, a depth that is penetrable with induced polarisation techniques.

Each of these modelled intrusive units are positioned along recently identified 'splay structures' trending from the main Celia Shear (please refer to GML ASX announcement 26 August 2025). These interpreted late intrusives act as rigid bodies within a ductile shear fabric framework, creating zones of dilation, rheological contrast and zones of deformation in which gold enriched fluids are deposited.

Great Western

The results from the gravity inversion modelling have successfully modelled the intrusion, as well as both the shear structures that wrap around the western contact of the unit (Figure 3). The recently announced high grade surface gold anomalism (please refer to GML ASX announcement 3 September 2025) maps the edge of this unit, and importantly it further emphasises that the limited historic drilling was conducted too far to the east of the main structural corridor (believed to be the source of the Mo-Bi-Te intersected in RC drilling), which remains entirely untested by drilling.

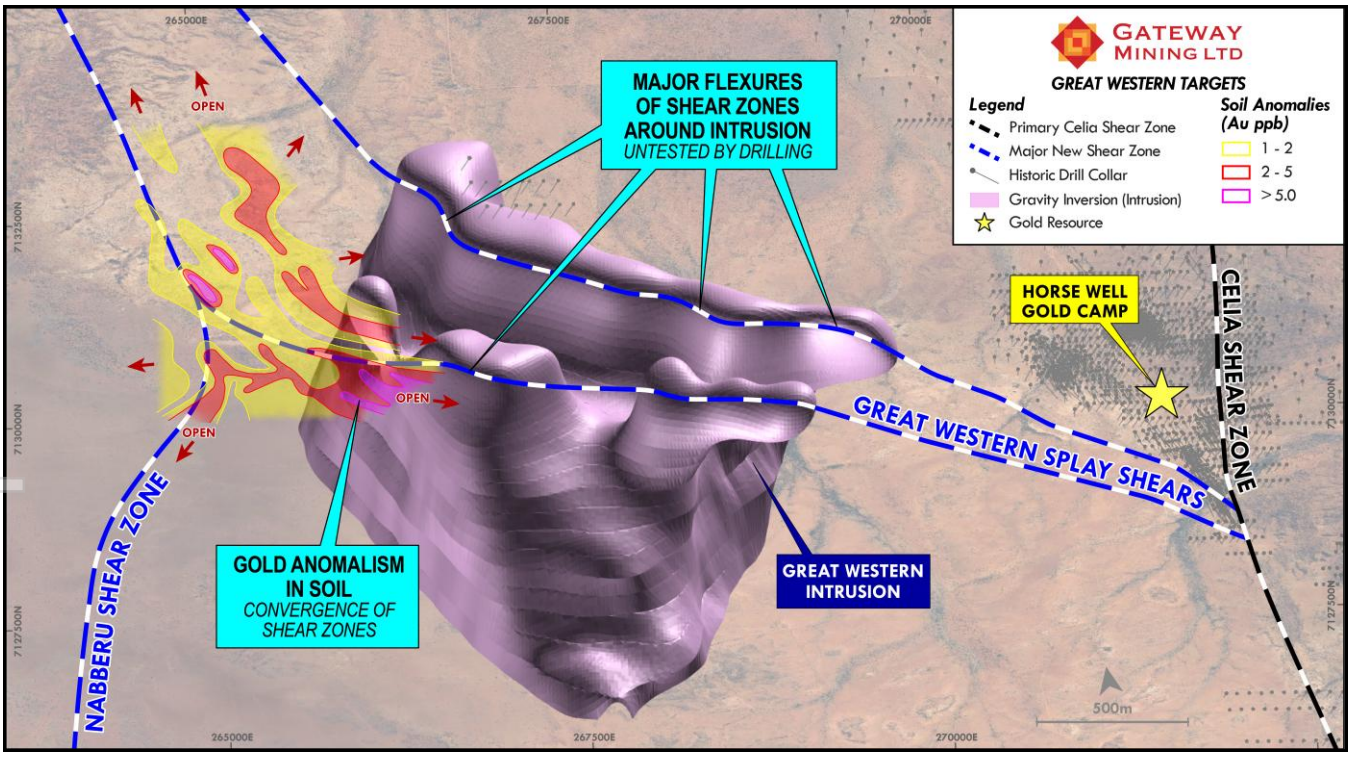

Figure 3: Results of Great Western gravity inversion modelling (pink) in relation to the Great Western Splay Structures and recently announced high grade surface gold anomalism. Google Earth image underlay.

At Great Western, the new gravity inversion model matches perfectly with the intersected granite unit at 185.1 metres in diamond drill hole GWDD001 (Figure 4), which validates and authenticates the inversion modelling process.

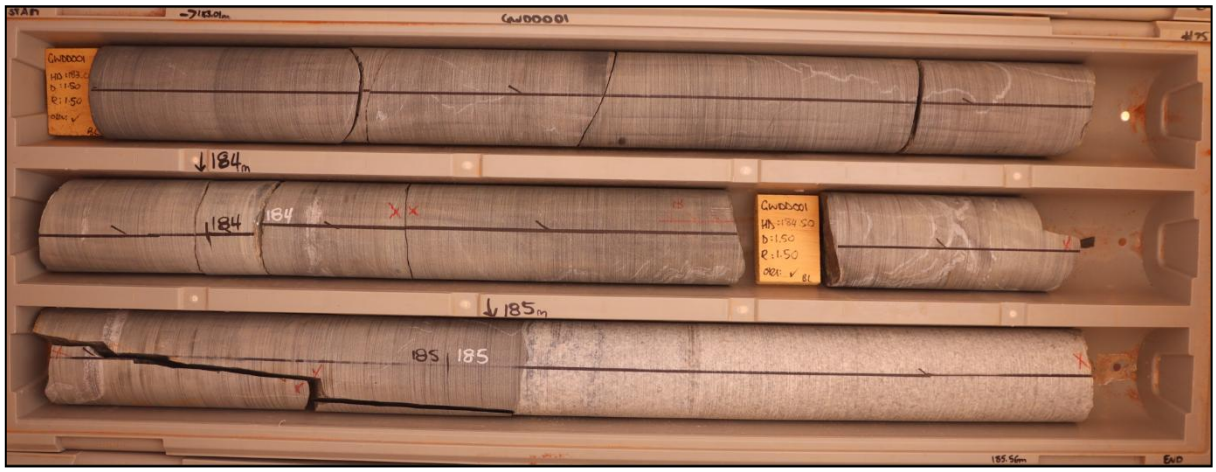

Figure 4: GWDD001 Diamond drill core highlighting the sediment-granite contact at 185.1 metres.[1]

Dusk 'til Dawn Gold Camp

Following on from the initial 200 metre spaced gravity inversion modelling, this higher resolution 50 metre spaced dataset has better constrained both the Eastern and Western intrusive units (Figure 5). The geochemically significant Au-Mo-Cu-Bi-Te trends and propylitic alteration corridors are clearly defined along structural lineaments, with the higher resolution survey also modelling these intrusive units to within 100 metres of surface.

The Eastern Target is a well-defined linear feature with coincident Au-Mo-Bi-Te-Cu on the western margin of the Eastern Intrusive. The Western Target however appears to be more structurally complex, with the Celia Shear wrapping around the western edge of this more deformed feature. Given the north-east orientation in the BOH geochemical anomalism across this target, this could potentially be highlighting a transform fault structure, with the main primary shear structure offset in this position.

A 3D Induced Polarisation survey is currently being undertaken across the Dusk 'til Dawn area, with the aim of mapping disseminated sulphide accumulations associated with the Au-Mo-Bi-Cu-Te anomalism. This program is on track to be completed by the end of this month, with results available almost immediately afterwards.

[1]Refer to Appendix B for assay results relating to GWDD001.

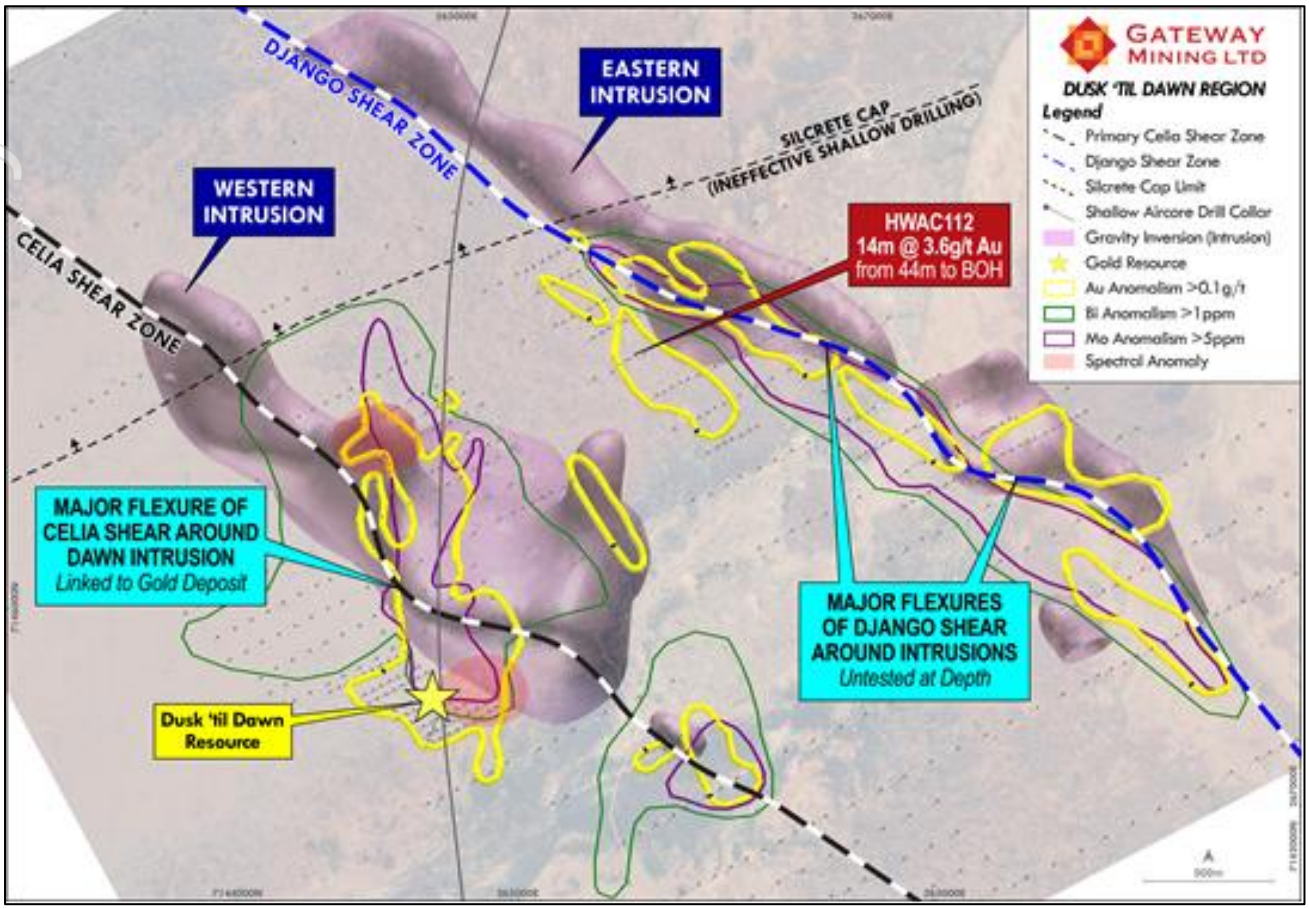

Figure 5: 200 metre spaced Dusk 'til Dawn inversion model in relation to BOH multi element geochemistry, key structural lineaments and the discovery of two zones of high temperature alteration (red) across the Western Intrusion.

Alteration Mapping – Dusk 'til Dawn

Strickland Metals submitted 170 bottom-of-hole (BOH) drill chip samples to ALS, Perth for the collection of hyperspectral infrared reflectance measurements using a Terra Spec 4 spectrometer, with results analysed by IMDEX utilising the aiSIRIS software. This work aimed to characterise the mineralogy of the drill samples to map alteration minerals across the Dusk 'til Dawn region to enhance first pass drill target testing.

From this work, the Company has identified two priority areas that returned distinct mineralogical characteristics (Figure 5). Across these areas, higher crystallinity and abundance of kaolinite and chlorite is observed in fresh rock, suggesting a higher-temperature component that is coincident with gold mineralisation and the recently recognised coincident geochemical anomalism (Mo-Cu-Bi-Te).

To better understand the geological setting associated with this anomalism, eight BOH samples were sent to Dr Tony Crawford for full petrological and lithogeochemical analysis.

Results identified that a potassic-rich (shoshonitic) sanukitoid intrusion, was emplaced into a sequence of fine-grained metasediments that included both volcaniclastic metasediments and craton-derived metapelites. A strong, feldspar-destructive hydrothermal alteration event occurred prior to deformation, generating a biotite/chlorite – quartz assemblage with minor pyrite (Figure 6). Deformation in a major fault zone led to extensive recrystallization and the development of a strong, closely spaced cleavage to schistosity in all rocks examined. Given the recent demonstration by Geological Society of Western Australia (GSWA) of the association of Au mineralisation in the Yilgarn Craton with sanukitoid intrusions[2], the presence of sanukitoid intrusive magmatism at Dusk 'til Dawn is very significant.

[2]Geological Survey of Western Australia, GSWA Record 2023/12 "Systematic Classification of Yilgarn Croton Granitic Rocks" Perth 2023.

Figure 6: Sample DDBH031 (57-58 metres) from HWAC207: Sanukitoid intrusion – very fine grained quartz biotite schist. Disseminated small former pyrite cubes now replaced by Fe oxy-hydroxides (black inclusions).

Pony-Colt-Haflinger Intrusives

The Pony Target represents a structurally complex and highly prospective area, defined by the convergence of the Mustang and Celia Shear Zones. This complexity is further enhanced by the flexure and kinking of the combined shear corridor around three discrete intrusions - termed Pony, Haflinger, and Colt - and crosscut by a series of northeast-trending structures (Figure 7).

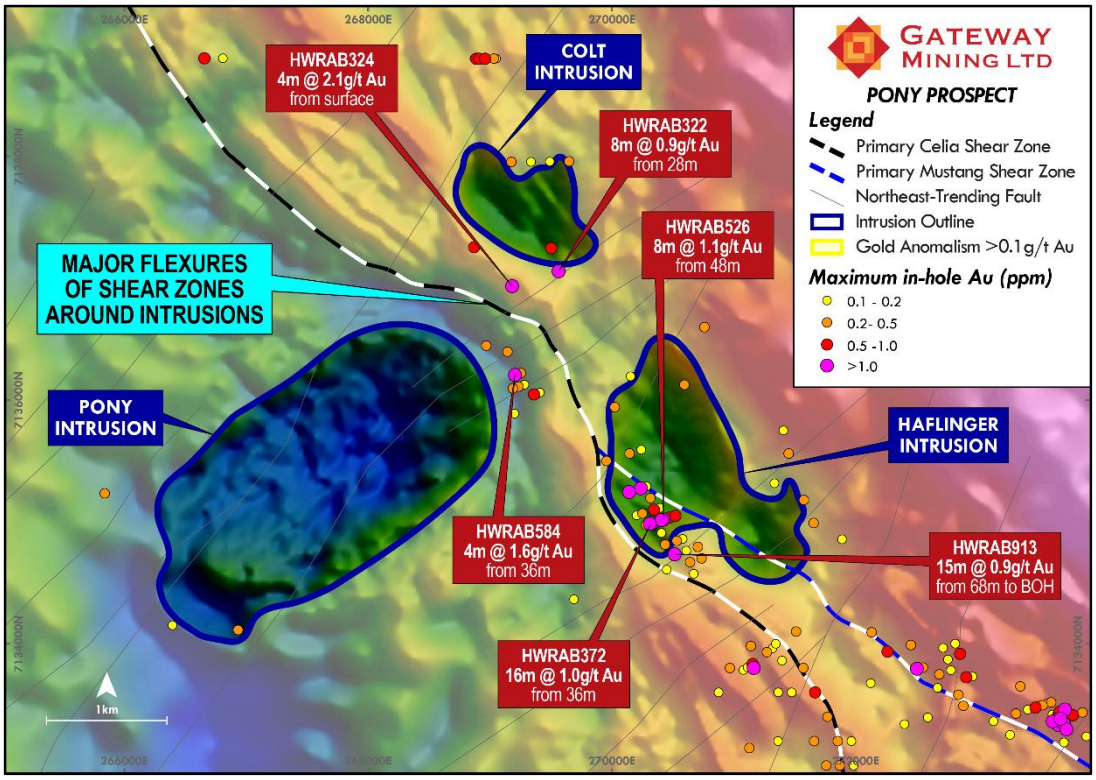

Figure 7: Topographic map showing the maximum in-hole Au (ppm) values from historic drilling in relation to recently modelled gravity intrusions. Coloured gravity image underlay.

This structural junction has generated multiple large-scale dilational zones spanning a minimum strike length of 4.5km, that are considered prime geological settings for significant gold deposition. Despite its compelling structural architecture, historic exploration has been limited to wide-spaced, shallow, vertical rotary-air-blast (RAB) drilling, with all holes terminating in weathered material.

Notably, this early-stage drilling returned encouraging supergene (oxide) gold intercepts, including 16m @ 1.0g/t Au from 36m (HWRAB372) and 15m @ 0.9g/t Au from 68m to end-of-hole (HWRAB913).

Gold anomalism remains open along strike, and no modern drilling has yet been undertaken to follow up these results, highlighting the untapped potential of the Pony Target for a major gold discovery only 4km north of the Horse Well Gold Camp.

Gateway will commence aircore drilling across the Pony Target in October 2025.

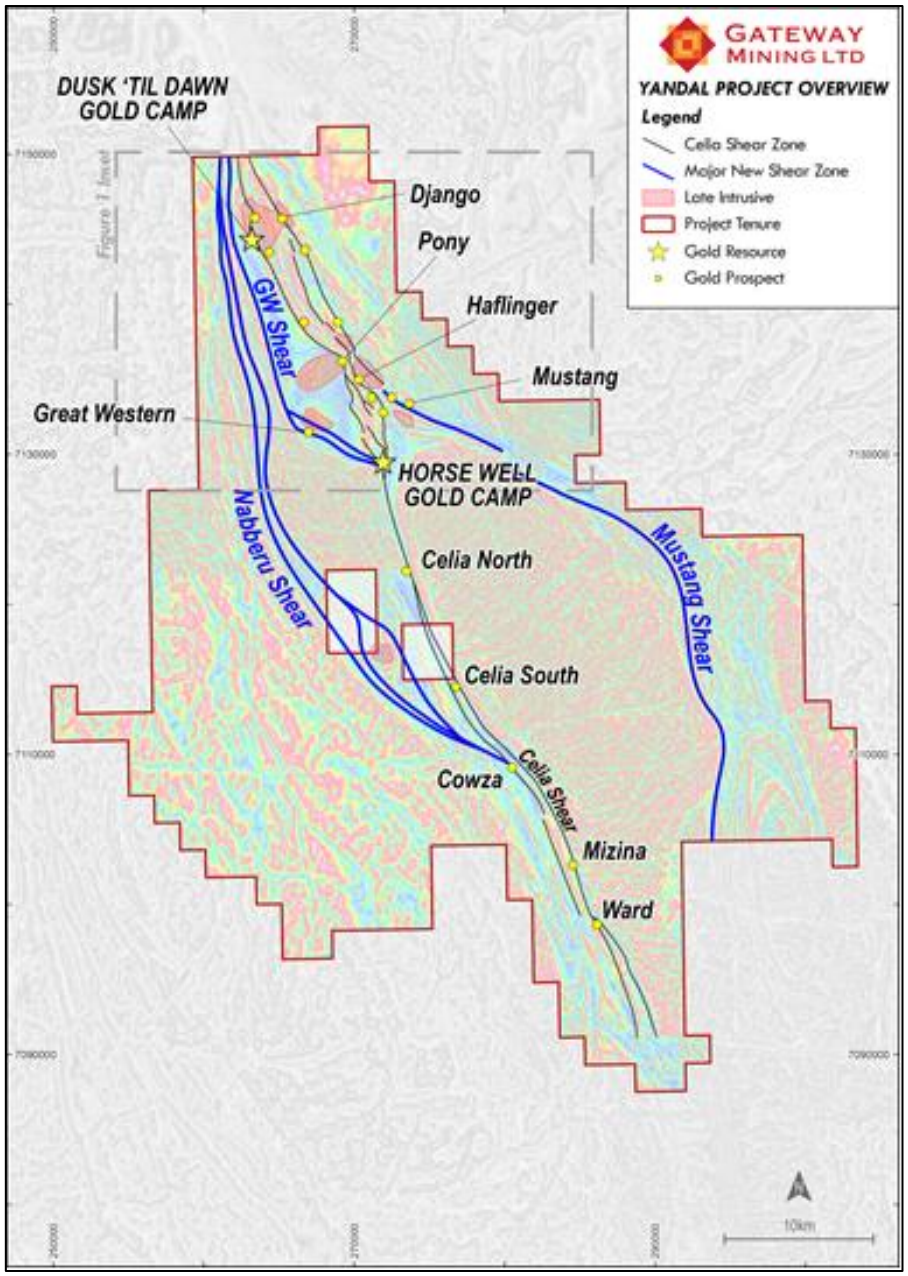

Figure 8: GML Yandal Project in relation to modelled intrusives and key mapped shear structures. Coloured TMI magnetic underlay.

Competent Person Statement

The information in this report that relates to Exploration Results is based on information compiled or reviewed by Mr Richard Pugh who is Gateway Mining Limited's Chief Executive Officer and is a current Member of the Australian Institute of Geoscientists (AIG). Mr Pugh has sufficient experience, which is relevant to the style of mineralisation and types of deposit under consideration and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code of Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Pugh consents to the inclusion in the report of the matters based on the information in the form and context in which it appears.

The information in this announcement that relates to Mineral Resources has been extracted from various Gateway ASX announcements and are available to view on the Company's website at www.gatewaymining.com.au or through the ASX website at www.asx.com.au (using ticker code "GML")

The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcement (dated 2 July 2025) and that all material assumptions and technical parameters underpinning the Mineral Resources in the relevant market announcement continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcement.

Forward Looking Statement

This announcement may contain certain forward-looking statements, guidance, forecasts, estimates, prospects, projections or statements in relation to future matters that may involve risks or uncertainties and may involve significant items of subjective judgement and assumptions of future events that may or may not eventuate (**Forward-Looking Statements**). Forward-Looking Statements can generally be identified by the use of forward-looking words such as "anticipate", "estimates", "will", "should", "could", "may", "expects", "plans", "forecast", "target" or similar expressions and may include, without limitation, statements regarding plans, strategies and objectives of management, anticipated production and expected costs. Indications of, and guidance on future earnings, cash flows, costs, financial position and performance are also Forward Looking Statements.

Persons reading this announcement are cautioned that such statements are only predictions, and that actual future results or performance may be materially different. Forward-Looking Statements, opinions and estimates included in this announcement are based on assumptions and contingencies which are subject to change, without notice, as are statements about market and industry trends, which are based on interpretation of current market conditions. Forward-Looking Statements are provided as a general guide only and should not be relied on as a guarantee of future performance.

No representation or warranty, express or implied, is made by Gateway that any Forward-Looking Statement will be achieved or proved to be correct. Further, Gateway disclaims any intent or obligation to update or revise any Forward-Looking Statement whether as a result of new information, estimates or options, future events or results or otherwise, unless required to do so by law.

Yandal Project JORC 2012 Mineral Resource Estimate

Table 1: Yandal Inferred Mineral Resource Estimates

Prospect	Tonnes (t)	Au (g/t)	Au (oz)	Cut-off
Palomino Pit	1,963,000	1.84	116,000	0.5
Palomino UG	155,000	2.69	13,500	2.0
Palomino Total	2,118,000	1.90	129,500	-
Warmblood	1,656,000	2.37	126,000	0.5
Filly	581,000	1.15	21,500	0.5
Bronco	324,000	1.38	14,500	0.5
HWGC Subtotal	**4,679,000**	**1.94**	**291,500**	**-**
Dusk 'til Dawn	3,495,600	1.00	108,900	0.5
Yandal Project Total	**8,174,600**	**1.52**	**400,400**	

Table Notes:

- Mineral Resources are based on JORC Code Definitions as defined by the Australasian Code for Reporting Results, Mineral Resources and Ore Reserves.
- All figures are rounded to reflect appropriate levels of confidence. Apparent differences may occur due to rounding.
- The Mineral Resource Estimate has been estimated using appropriate high-grade cuts, minimum mining widths and dilutions.
- Tonnes rounded to the nearest 1,000t, ounces rounded to the nearest 500oz.
- Refer to ASX announcement dated 2 July 2025 titled “Acquisition of Yandal Gold Project from Strickland Metals Ltd” for further details regarding the MRE.

			Easting (metres)	Northing (metres)	RL (metres)								
													0.05mm spots of leucoxene and tiny, tatty apatite crystals. Proportions of quartz to (altered) biotite vary irregularly within each chip.
Dusk 'til Dawn	HWAC703	DDBH022_pet	263802	7145762	540	67	66	67	-60	270	Group 2	basaltic (gabbroic) to andesite in composition	weathered and oxidized, fine-grained quartz-biotite schists in which all biotite has been altered to pale brown smectite. Ultrafine-grained, Fe-stained clays decorate the margins of many of the sub-0.05mm, angular quartz grains, which are unstrained. No trace of the protolith texture is preserved, but evenly disseminated, euhedral crystals of pyrite <0.1mm across and now replaced by red-brown Fe oxy-hydroxides make up ~0.5% of each chip.
Dusk 'til Dawn	HWAC207	DDBH031_pet	263620	7145656	540	58	57	58	-60	270	Group 4	Sanukitoid	distinctly high Mg', Ni, Cr and high Na, Sr and Sr/Y. fine-grained quartz-biotite schists in which all biotite has been altered to pale brown smectite.

APPENDIX F: JORC CODE, 2012 EDITION TABLE 1
Section 1 Sampling Techniques and Data
(Criteria in this section apply to all succeeding sections)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverized to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.*	**Newcrest** • Vertical RAB drilling conducted with sampling every 2m until refusal or hole failing in palaeochannels. • Samples were collected using a spear from sample piles. • Drilling was conducted on an initial 4.5km x 400m grid and later infilled to 1.5km x 400m. **Eagle Mining** • Eagle Mining operated in the Horse Well Project between 1993 and 1997. • RAB drilling was undertaken by Kennedy Drilling Pty Ltd using a custom built RAB rig using 600 CFM and 300PSI. • Samples were submitted to AAL in Kalgoorlie for analysis of Au using a single stage and grind preparation with an aqua regia digest and an AAS finish to a detection limit of 0.02ppm Au. No multi element analysis was undertaken during this time. **Alloy Resources** • Aircore drilling was completed by Raglan Drilling and were completed to blade refusal, usually at saprock or fresh bedrock to an average depth of 66 metres. • This reconnaissance drilling was carried out a widely spaced pattern of 200 metres by 400 metres, with drill samples composited over 4 metre intervals and assays for gold down to 0.001ppm or 1ppb Au. Any gold values greater than 0.05ppm Au in the 4-metre composite were considered significant to warrant follow up drilling. • Drilling samples were transported by trailer to Wiluna, where they were placed in bulky bags and shipped to Perth via Toll-Ipec for assay. The drilling samples were analysed by ALS-Chemex in Perth. All samples and blind standards were analysed for gold using 30g fire

Criteria	JORC Code explanation	Commentary
		assay and ICP-AES finish (range 0.001-10ppm Au). Assays greater than 10ppm were analysed using the AA25 methos, but only standard samples were above this level. • The initial RC program at Warmblood was carried out by Easternwell Drilling. RC samples were split directly from the cyclone into 2kg bags for every metre drilled. Samples were assayed as 4 metre composites. For all 4 metre composite samples which returned greater than 0.5g/t Au, 1 metre samples were collected from the original 'split' one metre samples and assayed. **Alloy Resources & Doray Minerals Ltd (JV)** From 2013 to 2021 exploration work was undertaken by Alloy Resources and Doray Minerals Ltd under the pre-existing JV agreement. The details regarding RC sampling from this work is outlined below: • Reverse circulation (RC) percussion drill chips collected through a cyclone and cone splitter at 1m intervals. • Spitter was cleaned regularly during drilling. • Splitter was cleaned and levelled at the end of each hole. • Mineralisation determined qualitatively through rock type, sulphide and quartz content and intensity of alteration. • Mineralisation determined quantitatively via assay (aqua-regia digest followed by ICP-MS for multi-element data and 25g Fire Assay and AAS determination for gold at 1m intervals). RC samples pulverized to 75 pm. • All samples analysed by aqua-regia digest followed by ICP-MS for multi-element data and 25g Fire Assay and AAS determination for gold at 1 m intervals. • Rock chip sampling was not undertaken on a grid, instead being completed at the geologist's discretion and whether outcrop was present. Whole rock samples were taken from gossanous in-situ material.

Criteria	JORC Code explanation	Commentary
		Strickland Metals Ltd **Diamond Drilling** • Diamond coring was undertaken predominantly as HQ sizing, with PQ utilized to maximise recovery, where required, particularly within saprolite and clay zones. • Triple-tubing was utilised throughout to maximise recovery. • Diamond core samples were collected at geologically defined intervals, with a minimum sample length of 0.5m and a maximum of 1.2m. • Core samples were cut using an automated variable-speed diamond saw with half core, weighing approximately 3kg, submitted for analysis. • OREAS certified reference material (CRM) was inserted at a ratio of 1:20 throughout sampling. The grade ranges of the CRMs were selected based on grade populations and economic grade ranges. The reference material type was selected based on the geology, weathering, and analysis method of the sample. • Density measurements were collected as per Water Displacement Method 3 (Lipton, 2001) with paraffin wax coatings used for oxide and porous samples. Selected core samples were 0.1 – 0.2 m in size. Aluminium cylinders of 0.1 and 0.2 m in length, with known mass and density were measured at regular intervals at a ratio of 1:20, as a reference material. Duplicate sample weights were measured in fresh rock at a ratio of 1:20. • Handheld instruments, such as an Olympus Vanta pXRF and Terraplus KT-10 meter were used to aid geological interpretation. CRMs were tested at regular intervals at a ratio of 1:20. **RC Drilling** • 2-3 kg samples were split from dry 1 m bulk samples. The sample was initially collected from the cyclone in an inline collection box, with independent upper and lower shutters. Once the full metre was drilled

Criteria	JORC Code explanation	Commentary
		to completion, the drill bit was lifted off the bottom of the hole, creating a gap between samples; ensuring the entirety of the 1 m sample was collected, and over-drilling did not occur. When the gap of air entered the collection box, the top shutter was closed off. Once the top shutter was closed, the bottom shutter was opened, dropping the sample under gravity over a cone splitter. • Two even 2 – 3 kg duplicate sample splits, from the A- and B-chutes of the splitter, were collected at the same time for each metre, with the remaining reject bulk sample being collected in labelled green bags directly below the cyclone, minimising external contamination. • Original sample bags were consistently collected from the A-chute, whilst duplicate sample splits were collected from the B-chute. During the sample collection process, the original and duplicate calico sample splits, and green bag of bulk reject sample were weighed to test for sample splitting bias and sample recovery. • Green bags were then placed in neat lines on the ground, with tops folded over to avoid contamination. Duplicate B-chute sample bags are retained and stored on site for follow up analysis and test work. • In mineralised zones, the original A-chute sample split was sent to the laboratory for analysis. In non-mineralised 'waste' zones, a 4 m composite scoop sample was collected from the green bags and the A-chute bag retained on site for follow up analysis test work. All composite intervals over 0.1 g/t Au were resampled at 1 m intervals using the original A-chute bag from the cyclone splitter. • QA samples were inserted at a combined ratio of 1:20 throughout. Field duplicates were collected at a 1:40 ratio from the B-chute of the cone splitter at the same time as the original sample was collected from the A-chute. OREAS certified reference material (CRM) was inserted at a ratio of 1:40. The grade ranges of the CRMs were selected based on grade populations and economic grade ranges. The reference material type was selected based on the geology, weathering, and analysis method of the sample. • The cyclone was cleaned after each rod, at the base of oxidation, and

Criteria	JORC Code explanation	Commentary
		when deemed necessary by the geologist to minimise contamination of samples. Sample condition was recorded for bias analysis. The cyclone was balanced at the start of each rod and checked after each sample to avoid split bias. Dual air-vibrators on the cyclone transfer box were utilised, when necessary, to aid sample throughput. Vibrators were placed on opposite sides of the cyclone and perpendicular to the chutes to avoid vibration-induced splitting bias. • Handheld instruments, such as an Olympus Vanta pXRF and Terraplus KT-10 meter were used to aid geological interpretation. CRMs were tested at regular intervals at a ratio of 1:20. **Rock Chip Sampling** • Rock chip sampling was not undertaken on a grid, instead being completed at the geologist's discretion and whether outcrop was present. Whole rock samples were taken from gossanous in-situ material. **Gateway Mining** • 60g of bottom-of-hole (BOH) sample was collected from the final metre of drill spoils at each drill site by Company personnel. • Samples were placed in pre-numbered paper geochemical bags, boxed and sent to the laboratory for full-suite multi-element analysis. Additional select samples were shipped to Petrographex for thin section preparation and petrographic interpretation.
Drilling techniques	• *Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).*	**Newcrest** • Drilling was completed using rotary-airblast and hammer in a vertical orientation by A&J Drilling using a Warman RAB rig. • Samples were collected using a spear from sample piles at 2-6m intervals, though typically at 2m. **Eagle Mining** • RAB drilling was undertaken by Kennedy Drilling Pty Ltd using a custom-built RAB rig using 600 CFM and 300PSI.

Criteria	JORC Code explanation	Commentary
		• Samples were submitted to AAL in Kalgoorlie for analysis of Au using a single stage and grind preparation with an aqua regia digest and an AAS finish to a detection limit of 0.02ppm Au. No multi element analysis was undertaken during this time. **Alloy Resources** • RC Drilling at Mustang was completed as one fence line perpendicular to the structural trend to test below aircore anomalism. • RC samples were split directly from the cyclone into 2kg bags for every metre drilled. Samples were assayed as 4 metre composites. For all 4 metre composite samples which returned greater than 0.5g/t Au, 1 metre samples were collected from the original 'split' one metre samples and assayed. • Aircore drilling was completed by Raglan Drilling and were completed to blade refusal, usually at saprock or fresh bedrock to an average depth of 66 metres. 1m samples were spear-sampled to create a 4m composite sample that was analysed by the laboratory. For all 4 metre composite samples which returned greater than 0.5g/t Au, 1 metre samples were collected from the original 'split' one metre samples and assayed. **Strickland Metals Ltd** **Diamond Drilling** • Diamond Drilling was undertaken by Terra Drilling using a truck-mounted KWL1600 drill rig. • Diamond coring was undertaken predominantly as HQ sizing, with PQ utilised to maximise recoveries where necessary. Triple-tubing was utilised to maximise recovery. • REFLEX Sprint IQ and OMNI-Tool North-Seeking Gyroscopes were used for downhole dip and azimuth calculation, with multi-shot measurements taken every 30m during drilling, and a continuous IN and OUT readings taken at end-of-hole (EOH). • RELFEX TN-14 Rig Aligner was used to align the rig to within 0.01

Criteria	JORC Code explanation	Commentary
		degrees of the planned azimuth, dip and roll at the start of each hole. • Boart Longyear Orientation tools were used for core orientation. **RC Drilling** • RC drilling was undertaken by Ranger Drilling, using a truck-mounted Hydco 350RC Rig with a 1350 cfm @ 500 psi on-board compressor, a 1150 cfm onboard Booster, and a truck-mounted Sullair 900 cfm @ 350 psi Auxiliary Compressor. • RC holes were drilled with a 5 ½" hammer. • REFLEX Sprint IQ and OMNI-Tool North-Seeking Gyroscopes were used for downhole dip and azimuth calculation, with multi-shot measurements taken every 30m during drilling, and a continuous IN and OUT readings taken at end-of-hole (EOH). • RELFEX TN-14 Rig Aligner was used to align the rig to within 0.01 degrees of the planned azimuth, dip and roll at the start of each hole.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximize sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	**Newcrest** • No details exist. **Eagle Mining** • No sample recovery information is available. **Great Central Mines** • No sample recovery information is available. **Alloy Resources** • No sample recovery information is available. • Wet samples due to excess ground water were noted when present. **Strickland Metals Ltd** **RC Drilling** • During the RC sample collection process, the original and duplicate cone split samples, and green bag reject bulk samples were weighed to test for bias and sample recoveries. The majority of this work was

Criteria	JORC Code explanation	Commentary
		undertaken in ore zones. • Once drilling reached fresh rock, a fine mist of water was used to suppress dust and limit loss of fines through the cyclone chimney. • At the end of each metre, the bit was lifted off the bottom of hole to separate each metre drilled. • The majority of samples were of good quality, with ground water having minimal effect on sample quality or recovery. • From the collection of recovery data, no identifiable bias exists. **Diamond Drilling** • Diamond core samples are considered dry. • Triple-tubing and the appropriate drill tube diameter was selected (PQ, HQ, or NQ) depending on ground competency to maximise sample recovery. • Sample recovery is recorded every run (average run length of 3m) and is generally above 98%, except for in very broken ground. • Core was cut in half, with the same half of the core submitted to the laboratory for analysis. • From the collection of recovery data, no identifiable bias exists.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.* • *The total length and percentage of the relevant intersections logged.*	**Newcrest** • Samples were logged qualitatively for lithology, texture, mineralogy, alteration and grain size for the entire length of holes. **Eagle Mining** • Logging of lithology, structure, alteration, veining, mineralisation, oxidation state, weathering, mineralogy, colour. RC Holes were logged to a level of detail to support future mineral resource estimation. Logging was qualitative and quantitative in nature. • Qualitative: lithology, alteration, foliation.

Criteria	JORC Code explanation	Commentary
		• Quantitative: vein percentage and mineralisation (sulphide) percentage. • All holes logged for the entire length of hole. • All RC holes were chipped and archived. • Holes have been relogged where necessary to provide consistent logging through the project. **Alloy Resources** • Logging of lithology, structure, alteration, veining, mineralisation, oxidation state, weathering, mineralogy, colour. Logging was qualitative in nature. • All holes were chipped and archived. • RC Holes were logged to a level of detail to support future mineral resource estimation. Logging was qualitative and quantitative in nature. • Qualitative: lithology, alteration, foliation. • Quantitative: vein percentage and mineralisation (sulphide) percentage. • Rock chip descriptions were recorded, including lithology and weathering state. **Strickland Metals Ltd** • Logging of lithology, structure, alteration, veining, mineralisation, oxidation state, weathering, mineralogy, colour, magnetic susceptibility and pXRF geochemistry were recorded. • Logging was both qualitative and quantitative in nature. • Mapping and rock chip sampling across the tenure was undertaken by senior geologists familiar with the Yandal Greenstone Belt and Earaheedy Basin lithologies. **Diamond Drilling**

Criteria	JORC Code explanation	Commentary
		• Diamond core was geotechnically logged at 1cm resolution; recording recovery, RQD, orientation confidence, joint density, joint sets, joint asperity and fill mineralogy. • Core trays were photographed wet and dry. • Structural measurements were collected utilizing the IMDEX IQ-Logger 2, with reference measurements taken at the start of each logging session and every 20 measurements throughout the drill hole to ensure instrument calibration and data quality. **RC Drilling** • RC chips were washed, logged and a representative sub-sample of the 1 m drill sample retained in reference chip trays for the entire length of a hole. • Reference chip trays were photographed wet and dry. **Gateway Mining** • Thin Sections were examined by Dr. Tony Crawford (Petrographex) using a Nikon Eclipse 50/POL microscope for petrographic interpretation.
Sub-sampling Techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	**Newcrest** • Samples were collected on 2m intervals using a spear. • Samples were sent to AAL, Perth. No details exist on the sample preparation. **Eagle Mining** • Samples were submitted to AAL in Kalgoorlie for analysis of Au using a single stage and grind preparation with an aqua regia digest and an AAS finish to a detection limit of 0.02ppm Au. No multi element analysis was undertaken during this time. **Alloy Resources** • RC chips were cone split every metre, sampled dry where possible and wet when excess ground water could not be prevented. Sample

Criteria	JORC Code explanation	Commentary
		condition (wet, dry or damp) was recorded at the time of logging. • Where mineralisation was unlikely in RC holes, the samples were composited by spear sampling – four x 1 metre subsamples combined to approximately 3kg and submitted for assay. • For AC drilling, 1m samples were sub-sampled using a spear and composited into a 4m sample and submitted for assay. Samples that returned anomalous results were subsequently re-sampled at 1m intervals using a spear. • No details exist regarding rock chip sample QAQC practises. **Strickland Metals Ltd** **RC Drilling** • RC samples were split from dry, 1m bulk sample via a cone splitter directly from the cyclone. • Weighing of calico and reject green samples to determine sample recovery compared to theoretical sample recovery, and check sample bias through the splitter. • Field duplicates collected from the B-chute of the splitter through the entire hole at the same time as the original sample collection from the A-chute. • Portable XRF analysis was undertaken on dry sample fines immediately after collection of the sample. **Rock Chip Samples** • Rock chip samples collected by Strickland Metals Ltd were sent to ALS in Perth and were crushed to 80% passing <2mm and pulverising prior to analysis for a full lithogeochemical characterisation (method code: CCPPKG01). **Diamond Drilling** • Diamond core samples were collected at geologically defined intervals, with a minimum sample length of 0.5m and maximum of

Criteria	JORC Code explanation	Commentary
		1.2m. • Samples were cut using an automated variable-speed diamond saw. • Core was cut in half, with the same half of the core submitted to the laboratory for analysis. • Diamond core samples are considered dry. • Triple-tubing and the appropriate drill tube diameter was selected (PQ, HQ, or NQ) depending on ground competency to maximise sample recovery. • Sample recovery is recorded every run (average run length of 3m) and is generally above 98%, except for in very broken ground. • Handheld instruments, such as an Olympus Vanta pXRF and Terraplus KT-10 Magnetic Susceptibility meter, were used to aid geological interpretation. Core was analysed at 1m intervals for 60 seconds (3 x 20 second beams) utilising an Olympus Vanta pXRF instrument. CRMs were tested at regular intervals at a ratio of 1:20. **Quality Control Procedures** • Approximately 3kg of sample was submitted to ALS, Perth WA for analysis via 50g fire assay with an ICP-AES finish (method code: Au-ICP22). Sample duplicates (DUP) were inserted at a ratio of 1:20 throughout sampling of ore zones, and 1:40 throughout sampling of waste material. • OREAS certified reference material (CRM) was inserted at a ratio of 1:20 throughout sampling of ore zones, and 1:40 throughout sampling of waste material. The grade ranges of the CRMs were selected based on grade populations and economic grade ranges. The reference material type was selected based on the geology, weathering, and analysis method of the sample. • The total combined QAQC (DUPs and CRMs) to sample ratio through ore zone material was 1:10. For waste zones the combined QAQC to sample ratio was 1:20.

Criteria	JORC Code explanation	Commentary
		• Field Duplicates and CRMs were submitted to the lab using unique Sample IDs. • For Fire Assay, all samples were sorted, dried at 105°C and weighed prior to crushing to 2mm. Crushed samples were then split and pulverised to 75µm, with a QC specification of ensuring >85% passing < 75µm. 50g of pulverised sample was then analysed for Au by fire assay and ICP-AES (low-grade) or gravimetric (ore-grade) finish. • Sample size and preparation is appropriate for the grain size of the sample material. **Gateway Mining** • Select BOH samples of interest were sent to Petrographex (Dr Tony Crawford) for thin section interpretation. Samples were prepared into covered thin sections by Adelaide Petrographic, Adelaide. • BOH samples were sent to ALS in Perth and were crushed to 80% passing <2mm and pulverised prior to completing multi-element analysis (method code: ME-MS61L) on 0.25g of pulp.
Quality of assay data and Laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.*	**Newcrest** • Samples were analysed at AAL, Perth by Au-BLEG and Pd-BLEG achieving detection limits of 0.1ppm and 0.01ppm, respectively. • The internal laboratory precision is noted as 10%. **Eagle Mining** • The majority of samples were analysed using Aqua Regia which is a partial analysis. • No information was recorded regarding QAQC or sampling practices at this time. **Alloy Resources** • Fire assay was used and is a total digest technique for RC samples, and a mix of Fire Assay and Aqua Regia was used for aircore samples and rock chip samples.

Criteria	JORC Code explanation	Commentary
		• Certified reference material standards were inserted at 1 in every 50 samples. • Lab: Random pulp duplicates were taken on average 1 in every 10 samples. • Accuracy and precision levels have been determined to be satisfactory after analysis of these QAQC samples. • Quality control procedures are not outlined in WAMEX archive reports for rock chip samples. **Strickland Metals Ltd** **RC Drilling** • 2-3 kg samples were split from dry 1 m bulk samples. The sample was initially collected from the cyclone in an inline collection box, with independent upper and lower shutters. Once the full metre was drilled to completion, the drill bit was lifted off the bottom of the hole, creating a gap between samples; ensuring the entirety of the 1 m sample was collected, and over-drilling did not occur. When the gap of air entered the collection box, the top shutter was closed off. Once the top shutter was closed, the bottom shutter was opened, dropping the sample under gravity over a cone splitter. • Two even 2 – 3 kg duplicate sample splits, from the A- and B-chutes of the splitter, were collected at the same time for each metre, with the remaining reject bulk sample being collected in labelled green bags directly below the cyclone, minimising external contamination. • Original sample bags were consistently collected from the A-chute, whilst duplicate sample splits were collected from the B-chute. During the sample collection process, the original and duplicate calico sample splits, and green bag of bulk reject sample were weighed to test for sample splitting bias and sample recovery. • Green bags were then placed in neat lines on the ground, with tops folded over to avoid contamination. Duplicate B-chute sample bags are retained and stored on site for follow up analysis and test work.

Criteria	JORC Code explanation	Commentary
		• In mineralised zones, the original A-chute sample split was sent to the laboratory for analysis. In non-mineralised 'waste' zones, a 4 m composite scoop sample was collected from the green bags and the A-chute bag retained on site for follow up analysis test work. All composite intervals over 0.1 g/t Au were resampled at 1 m intervals using the original A-chute bag from the cyclone splitter. • QA samples were inserted at a combined ratio of 1:20 throughout. Field duplicates were collected at a 1:40 ratio from the B-chute of the cone splitter at the same time as the original sample was collected from the A-chute. OREAS certified reference material (CRM) was inserted at a ratio of 1:40. The grade ranges of the CRMs were selected based on grade populations and economic grade ranges. The reference material type was selected based on the geology, weathering, and analysis method of the sample. • The cyclone was cleaned after each rod, at the base of oxidation, and when deemed necessary by the geologist to minimise contamination of samples. Sample condition was recorded for bias analysis. The cyclone was balanced at the start of each rod and checked after each sample to avoid split bias. Dual air-vibrators on the cyclone transfer box were utilised, when necessary, to aid sample throughput. Vibrators were placed on opposite sides of the cyclone and perpendicular to the chutes to avoid vibration-induced splitting bias. **pXRF Analysis** • Handheld instruments, such as an Olympus Vanta pXRF and Terraplus KT-10 meter were used to aid geological interpretation. CRMs were tested at regular intervals at a ratio of 1:20. • Samples were analysed using the Geochem-3 method with 3 beams of 20 seconds. • The instrument was calibrated at the start of each analysis session, with a QC reading taken on alternating Certified Reference Materials (Silica Blank and OREAS45d) at a ratio of 1:20 samples. • CRM readings collected using the pXRF were scrutinised in ioGAS software to check reliability of results and to ensure no contamination

Criteria	JORC Code explanation	Commentary
		was present on the window of the instrument. • Handheld XRF readings were taken on pulverized material from dry samples throughout a hole where the geologist determined geochemical data was necessary to determine lithology and in areas of alteration or assumed mineralisation. • Elemental pathfinder data related to the alteration and mineralised system was interpreted in ioGAS software and cross-validated with visual observations in drill hole (chip) material. • The elements reported in the body of this release – Molybdenum (Mo), Bismuth (Bi) and Tungsten (W) – have < 5 ppm limit of detection (LOD) for pXRF analysis. "ND" is utilised in the table of results to stipulate when an element was not detected. • Rare-elements such as gold, most rare-earth-elements (REEs) and all light elements (hydrogen through to sodium) cannot be analysed utilising a handheld pXRF instrument. • pXRF results are a guide only and should not be considered equivalent to laboratory-analysed sample results. **Rock Chip Samples** • The analysis method for rock chip samples is considered total. **Diamond Drilling** • Diamond coring was undertaken predominantly as HQ sizing, with PQ utilized to maximise recovery, where required, particularly within saprolite and clay zones. • Triple-tubing was utilised throughout to maximise recovery. • Diamond core samples were collected at geologically defined intervals, with a minimum sample length of 0.5m and a maximum of 1.2m.

Criteria	JORC Code explanation	Commentary
		• Core samples were cut using an automated variable-speed diamond saw with half core, weighing approximately 3kg, submitted for analysis. • OREAS certified reference material (CRM) was inserted at a ratio of 1:20 throughout sampling. The grade ranges of the CRMs were selected based on grade populations and economic grade ranges. The reference material type was selected based on the geology, weathering, and analysis method of the sample. • Handheld instruments, such as an Olympus Vanta pXRF and Terraplus KT-10 meter were used to aid geological interpretation. CRMs were tested at regular intervals at a ratio of 1:20. **Gateway Mining** • The analysis method for BOH samples is considered total. • ALS performed analysis checks and inserted CRM into the sample sequence prior to analysis.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• No holes have been twinned. • No adjustments were made to any of the assay data. • All data is managed and hosted by Mitchell River Group who acted as the Database Manager for Strickland Metals and now Gateway Mining. During Strickland's ownership, QAQC and historical data compilation was completed. **Newcrest** • Data is present in hardcopy files from AAL and scanned paper maps showing drillhole locations. **Eagle Mining** • Logging and sampling were recorded on paper logs. Alloy Resources transferred these logs to digital format and loaded them into the corporate database. **Alloy Resources**

Criteria	JORC Code explanation	Commentary
		• All sampling was routinely inspected by senior geological staff. Significant intercepts were inspected by senior geological staff. • Data was hard keyed into Excel data capture software and merged with Datashed SQL based database on Strickland's internal company server. Data is validated by a Database Administrator, import validation protocols in place. • Visual checks of data were completed within Surpac software by consultant geologists. **Strickland Metals Ltd** • Logging, pXRF data and sampling were recorded directly into LogChief, utilising lookup tables and in-file validations, on a Toughbook by a geologist at the rig. • Logs and sampling were imported daily into Micromine for further validation and geological confirmation. • When received, assay results were plotted on section and verified against neighbouring drill holes. • From time to time, assays were repeated if they failed company QAQC protocols. • All data was verified by Strickland's senior geologists. **Gateway Mining** • No adjustments to assay data have been made. Elemental ratios, such as Ti/Zr have been applied to aid in discrimination of the lithogeochemical unit, such as Mafics vs Felsics.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	**Newcrest** • Drill collar coordinates are handwritten on paper logs and plotted on topographic maps in a local grid. **Eagle Mining** • The grid system used was MGA94 Zone 51. Historic holes were

Criteria	JORC Code explanation	Commentary
		surveyed by DGPS or handheld GPS by Strickland Metals. • Topography was built using collar surveys surveyed by DGPS. **Alloy Resources** • Collars and rock chip samples: surveyed with GPS with expected relative accuracy of approximately 2-3m. • Downhole: surveyed with in-rod reflex Gyro tool continuously. • Holes are located in MGA94 zone 51. • Estimated RL's were assigned during the drilling. **Strickland Metals Ltd** • The grid system used was MGA94 Zone 51 and drillhole collar positions surveyed using DGPS that has an accuracy of +/- 3cm, and for rock chip samples using a handheld Garmin GPS that has an accuracy of +/- 3m. • REFLEX Sprint IQ and OMNI-Tool North-Seeking Gyroscopes were used for downhole dip and azimuth calculation, with multi-shot measurements taken every 30m during drilling, and a continuous IN and OUT readings taken at end-of-hole (EOH). • RELFEX TN-14 Rig Aligner was used to align the rig to within 0.01 degrees of the planned azimuth, dip and roll at the start of each hole. • Strickland engaged with an independent surveyor to pick up and locate all collars that had not been subject to a DGPS pick-up previously. **Gateway Mining** • **Ground Gravity Survey** Atlas Geophysics utilize a Scintrex CG5 digital gravity meter to collect the ground gravity data. The survey was positioned with CHC GNSS receivers operating in PPK mode. All data were tied to the AFGN using a single control stations. Expected accuracy of the gravity survey would be better than 0.02 mGal with recorded elevations accurate to

Criteria	JORC Code explanation	Commentary
		better than 3cm. Gravity stations were routinely collected at 50 metre intervals.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• Unless stated otherwise in the body of text, reported intercepts for Great Western include a maximum total internal waste of 12m for intercepts over 30m, or less than 1/3rd of the intercept width, with an average of 3m. A maximum continuous internal waste of 2m is applied for reported intercepts, unless stated otherwise. • No compositing of individual samples has been applied for Mustang, Nabberu and Horse Well, all results reported are single interval (typically 1m length) samples. The maximum value of gold (Au) is displayed on diagrams in the body of text. **Eagle Mining/Newcrest** • The majority of the historic vertical RAB drilling completed by Eagle Mining were on wide spaced 200m x 200m spacings (Eagle Mining) and 1.5km x 400m spacing (Newcrest). This style of drilling, coupled with the partial aqua regia/BLEG assay analysis and wide spaced drill collar spacings indicate that this is not adequate for any mineral resource reporting. **Alloy Resources** • AC drilling was completed at 400mNW x 200mNE spacing and infilled to 200m x 200m spacing, where mineralisation was intercepted at Mustang. • One fence line of RC drilling as completed at Mustang on 100m spacing, drilling -60 degrees to the SE. No lateral continuity of mineralisation has been determined. • Rock chip samples were collected at each outcrop as deemed necessary by the geologist. No nominal sample spacing was used for rock chip sampling. **Strickland Metals Ltd** • First pass RC and diamond drilling was completed at the Great Western target. The spacing of the RC is insufficient for resource

Criteria	JORC Code explanation	Commentary
		classification and only a single diamond hole has been completed at the prospect to date. • Rock chip sampling was carried out over areas of geological interest and at each outcrop as deemed necessary by the geologist. No nominal sample spacing was used for rock chip sampling. **Gateway Mining Ltd** • **Ground Gravity Survey** Gravity stations were planned at 50m by 50m station spacings.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• Based on the geophysical re-processing of recently acquired airborne magnetic data, coupled with the recently acquired ground gravity data, RC, DD and aircore drilling was conducted perpendicular to the strike of key geological and structural units. • RAB and Vacuum drilling was conducted vertically to a shallow depth, which is deemed reasonable given the horizontal nature of transported cover and supergene mineralisation. Drilling did not penetrate in-situ fresh material, thus structural orientation is not deemed relevant for shallow holes. • Lithogeochemical categorisation and mapping at Mustang shows that gold mineralisation predominantly sits along the contact between mafic volcanics and intermediate volcanic(lastics), with historic drilling being conducted in fencelines that run perpendicular to the strike of mineralisation and the contact.
Sample security	• *The measures taken to ensure sample security.*	**Newcrest** • No details exist. **Eagle Mining** • The data was originally maintained by Eagle Mining Corporation and forwarded to Normandy Jundee Operation. **Alloy Resources** • Alloy Resources' historic samples sent to the laboratory by Company

Criteria	JORC Code explanation	Commentary
		personnel. • The database and Chain of Custody of sample data was managed by a dedicated Company employee. **Strickland Metals Ltd** • Strickland Metals Ltd managed Chain of Custody of digital data. • All samples were bagged in tied numbered calico bags, grouped into larger polyweave bags and cabled-tied. Polyweave bags were placed into larger Bulky Bags with a sample submission sheet and tied shut. Delivery address details were written on the side of the bag. • Sample material was stored on site and, when necessary, delivered to the assay laboratory by Strickland Metals personnel and a nominated courier (DFS). • Thereafter, laboratory samples were controlled by the nominated laboratory. • Digital sample control files and hard-copy ticket books-controlled sample collection. **Gateway Mining** • BOH sample material was stored on site and, when necessary, delivered to the assay laboratory by Company personnel. • Thereafter, laboratory samples were controlled by the nominated laboratory. • Digital sample control files and hard-copy ticket books-controlled sample collection. • Petrographic samples were sent via courier to Petrographex.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	**Eagle Mining/Newcrest** • All drilling has been plotted, checked in section and three dimensions to recent drilling to ensure that historic drilling, geology, drill intercepts, and hole locations are more thoroughly documented valid.

Criteria	JORC Code explanation	Commentary
		• Approximately 80% of drillholes have been visited on the ground or checked via satellite imagery to validate their collar location. **<u>Strickland Metals</u>** • All assay data was audited and reviewed by Mitchell River Group (MRG), with weekly performance meetings held between Strickland Personnel and the Database Manager at MRG. • Gravity Inversion models were processed by Terra Resources, external geophysical consultants. • Airborne magnetic stitching or regional datasets and subsequent re-processing of this data was overseen by Terra Resources in June 2025. • Dr. Nigel Brand additionally reviewed multi-elemental data at Mustang, carrying out lithogeochemical characterisation and comparing gold mineralisation trends to distinct lithological contacts and shear zones. • Dr. Tony Crawford (Petrographex) completed petrographic interpretation of thin sections.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Mustang and Great Western shear structures cover all Yandal tenements that are 100% owned and operated by Gateway Mining Ltd. • The southern part of the Celia and Nabberu shear structures over tenure that is held in Joint Venture (JV) between Gateway Mining Ltd 75% and Zebina Minerals Pty Ltd and includes the following tenements: E 53/1971

Criteria	JORC Code explanation	Commentary
		E 53/1835 E 53/1970 E 53/2266 E 53/2265 E 53/2357 E 53/1548 • Dusk 'til Dawn is located within E69/2492. • The Horse Well Gold Camp is located on E69/1772 • MW Royalty Co Pty Ltd holds a 1% gross revenue royalty over the above tenure. • Wayne Jones holds a 2% net smelter return royalty over E69/2492.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• Exploration prior to Strickland in the region was conducted by Eagle Mining and Great Central Mines Ltd. Drilling included shallow RAB and RC drilling that was completed in the mid – 1990s, all of which had been sampled, assayed, and logged and records held by Gateway. This early work, including aeromagnetic data interpretation, was focused on gold and provided anomalous samples which was the focus of this period of exploration.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• Archean aged gold prospects with common host rocks and structures related to mesothermal orogenic gold mineralisation as found throughout the Yilgarn Craton of Western Australia.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* o *easting and northing of the drill hole collar* o *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* o *dip and azimuth of the hole*	• Historic gold intercepts have been compiled, with a summary of all information documented in the accompanying Appendices. • All collar location and depth information are also included in the Appendices.

Criteria	JORC Code explanation	Commentary
	○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• No top-cuts have been applied when reporting results. • No metal equivalent values were used for reporting of exploration results.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• The wide-spaced nature of the historic vertical RAB drilling along the Mustang and Nabberu Shear Zones are too wide spaced and shallow to determine the structural orientation of these features. • At Dusk 'til Dawn the exact structural geometry of the mineralisation is not yet known due to insufficient diamond drilling in the targeted areas. Broad geological and mineralisation features have been interpreted from available drilling sections. • Drilling intercepts are reported as down-hole width.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	Please refer to the main body of text.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration*	• All gold assays are presented in the appendix to this announcement for clarity, including drill holes that returned mineralisation above 0.1g/t Au.

Criteria	JORC Code explanation	Commentary
	Results.	
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• All meaningful and material information has been included in the body of the text and Appendices. **Ground Gravity Survey** • Atlas Geophysics utilized a Scintrex CG5 digital gravity meter to collect the ground gravity data. The survey was positioned with CHC GNSS receivers operating in PPK mode. All data were tied to the AFGN using a single control stations. Expected accuracy of the gravity survey would be better than 0.02 mGal with recorded elevations accurate to better than 3cm. Gravity stations were routinely collected at 50m metre intervals. • A high-resolution gravity survey was initially completed across Dusk 'til Dawn at 50m x 50m station spacings to aid structural and geological modelling of intrusive features in which to subsequently drill test. This survey was extended further to the south to cover Pony and Mustang prospects. During this period, a 200m x 200m survey was completed across the Nabberu shear structure to enable first pass structural interpretation. **Airborne Magnetic Re-processing** • Terra Resources were engaged in June 2025 to undertake aeromagnetic stitching and subsequent re-processing of the project wide regional airborne magnetic compilation. This included the incorporation of both the Lorna Glen and Iroquois surveys that were flown in an east west direction, line spacing 50m and flying height of 30m. Tie lines were flown orthogonal at 500m spacing. • The Total Magnetic Intensity grid which forms the base layer from which these images were created was a merge of 14 aeromagnetic surveys of varying line spacing, flying height and line direction. These surveys were flown between 1991 and 2024. The following imagery was created to aid structural interpretation: • *Yandal_MillHWUVmerge_iroquois_sti2025_TMI_lin_gs.tif* - Total

Criteria	JORC Code explanation	Commentary
		Magnetic Intensity with a linear histogram stretch applied, shown in greyscale. • *Yandal_MillHWUVmerge_iroquois_sti2025_TMI_hn_gs.tif* - Total Magnetic Intensity with a histogram normalised stretch applied, shown in greyscale. • *Yandal_MillHWUVmerge_iroquois_sti2025_TMI_sun04555.tif* - Total Magnetic Intensity with sun illumination. Sun declination is 45º and inclination is 55º. A histogram equalisation stretch has been applied. • *Yandal_MillHWUVmerge_iroquois_sti2025_TMIVD1_hn_gs.tif* – First Vertical Derivative of Total Magnetic Intensity with a histogram normalised stretch applied, shown in greyscale. • *Yandal_MillHWUVmerge_iroquois_sti2025_TMI_AS_sun04555.tif* - Analytic Signal of Total Magnetic Intensity. Sun declination is 45º and inclination is 55º. A histogram equalisation stretch has been applied. • *Yandal_MillHWUVmerge_iroquois_sti2025_TMI_AS_sun04555_plin.tif* - Analytic Signal of Total Magnetic Intensity. Sun declination is 45º and inclination is 55º. A piecewise linear histogram stretch has been applied. • *Yandal_MillHWUVmerge_iroquois_sti2025_TMI_ASOMI_sun04555.tif* – Analytic Signal of Magnetic Integral. Sun declination is 45º and inclination is 55º. A histogram equalisation stretch has been applied. • *Yandal_MillHWUVmerge_iroquois_sti2025_RTP_lin_gs.tif* - Total Magnetic Intensity Reduced to Pole with a linear histogram stretch applied, shown in greyscale. • *Yandal_MillHWUVmerge_iroquois_sti2025_RTP_hn_gs.tif* - Total Magnetic Intensity Reduced to Pole with a histogram normalised stretch applied, shown in greyscale. • *Yandal_MillHWUVmerge_iroquois_sti2025_RTP_sun04555.tif* - Total Magnetic Intensity Reduced to Pole with sun illumination.
