2 December 2025

GOLDEN GATE DISCOVERY GROWS WITH MULTIPLE GOLD INTERCEPTS AT HORSE HEAVEN DRILL PROGRAM

CONTINUOUS GOLD MINERALISATION IDENTIFIED FROM SURFACE IN MULTIPLE HOLES CONFIRMING A LARGE INTRUSION-RELATED GOLD SYSTEM OPEN ALONG STRIKE AND AT DEPTH – 5.91 G/T & 3.98 G/T HIGHEST ASSAY RESULTS. TO DATE, SIX REPORTED DIAMOND HOLES FORM PART OF A PLANNED 57-HOLE DRILLING PROGRAM TESTING A 3,000M STRIKE LENGTH.

Highlights

- Broad gold intervals returned from latest diamond core holes HH-GG25-004C, HH-GG25-005C, and HH-GG25-007C.
- Near-continuous gold mineralisation defined over a strike length of 600m in six diamond drill holes, mineralisation open along strike, to the east, and at depth.
- To date, the Company has reported results from six diamond core holes at Golden Gate North, these holes form part the initial phase of the planned 57-hole drilling program designed to test a 3,000m strike length across the Golden Gate Prospect.
- Results confirm a large intrusion-related gold system ("IRGS") at Golden Gate in the Stibnite Mining District.
- Final assays extend HH-GG25-001C to **197.5m @ 1.26 g/t from 34.0m**, confirming mineralisation is open at depth.
- New long intercepts from the latest diamond drilling include:
    - **HH-GG25-004C: 240.8m @ 0.64 g/t gold from surface to end-of-hole ("EOH") 240.8m** (open ended), including:
        - **61.6m @ 0.98 g/t gold from 40.5m; and**
        - 35.8m @ 0.83 g/t gold from 119.5m.
    - **HH-GG25-005C: 283.5m @ 0.36 g/t gold from surface to EOH 283.5m** (open ended), including:
        - 4.7m @ 1.18 g/t gold from 10.1m;
        - **42.5m @ 0.72 g/t gold from 65.7m;**
        - 4.2m @ 1.14 g/t gold from 131.1m; and
        - 4.9m @ 0.76 g/t gold from 176.8m.

- **HH-GG25-007C: 207.2m @ 0.42 g/t gold from surface**, including:
  - 4.45m @ 1.18 g/t gold from 50.7m; and
  - 3.7m @ 2.65 g/t gold from 176.5m.

- Previously reported Golden Gate North holes delivered additional long mineralised intervals including **gold from surface to 253.0m** ending in mineralisation, in HH-GG25-003C, including:
  - HH-GG25-003C: **253.0m @ 1.50 g/t from surface**, ending in mineralisation, including **111.9m @ 2.31 g/t gold from 130.5m** and **18.3m @ 3.98 g/t gold from 149.4m** (with the highest assay result of 5.91 g/t gold over a down hole width of 1.5m).
  - HH-GG25-002C: **265.2m @ 0.60 g/t gold from surface,** ending in mineralisation in including **89.9m @ 1.15g/t gold from 121.9m**.
- Reverse Circulation ("RC") drilling at Golden Gate North (four holes) completed with assays pending.
- Phase 1 diamond drilling program at Gold Gate (ten holes) completed, with assays for HJH-GG25-006C and southern Gold Gate holes HH-GG25-008C to HH-GG25-010C pending.
- Acquisition of a 25-arcre processing and infrastructure site adjoining Horse Heaven, positions Resolution with a potential future hub for gold, antimony and tungsten processing in the Stibnite Mining District.

RML's CEO of US Operations, Craig Lindsay, commented on the discovery:

"These latest results materially advance our understanding of Golden Gate. We now have six diamond core holes, all returning broad, continuous gold mineralisation at or near surface and several of them end in mineralisation. Together they define a large intrusion-related gold system of at least 600m of strike that is open along strike, the east and at depth. ***It should be noted that the initial six holes reported cover only 600m of the total 3.0km strike length of Golden Gate. Further, these first six holes reported comprise only a small portion of the 57 holes that are planned to be drilled at Golden Gate.***

Golden Gate sits only 6km from the fully-permitted Stibnite Gold Project and alongside the processing site we are in the process of acquiring. That combination of scale potential, district infrastructure and a clear path to downstream processing, gives us confidence that Horse Heaven can grow into a significant multi-commodity project for Resolution and its shareholders."

Resolution Minerals Ltd (ASX: RML; OTCQB: RLMLF) ("Resolution" or "Company") is pleased to report further very positive drill results from its maiden drill program at its 100% owned Horse Heaven Gold-Antimony-Tungsten-Silver Project ("Horse Heaven" or the "Project"), Idaho, USA (Figure 1). The latest assays from the Golden Gate Prospect continue to demonstrate broad, near-surface gold mineralisation and confirm Golden Gate North as a significant new gold discovery within the Stibnite Mining District.

Assay results have now been received for diamond drill holes HH-GG25-004C, HH-GG25-005C, and HH-GG25-007C which, together with previously announced HH-GG25-001C, HH-GG25-002C, and HH-GG25-003C have delineated gold mineralisation over a strike length of 600m at Golden Gate North. Multiple holes report long, continuous intercepts from surface and several ending in mineralisation, with the system remaining open along strike, to the east and at depth.

Final assay results of the lower-most section of HH-GG25-001C, which were not available at the time of the 28 October 2025 announcement, show that previously reported mineralisation in HH-GG25-001C now extends for the entire hole, from surface and the end of the hole. The revised down hole interval for HH-GG25-001C is 197.5m @ 1.26 g/t from 34.0m.

As seen in HH-GG25-001C, HH-GG25-002C and HH-GG25-003C, gold mineralisation in the new holes is associated with pyrite and arsenopyrite, supporting an IRGS model at Golden Gate.

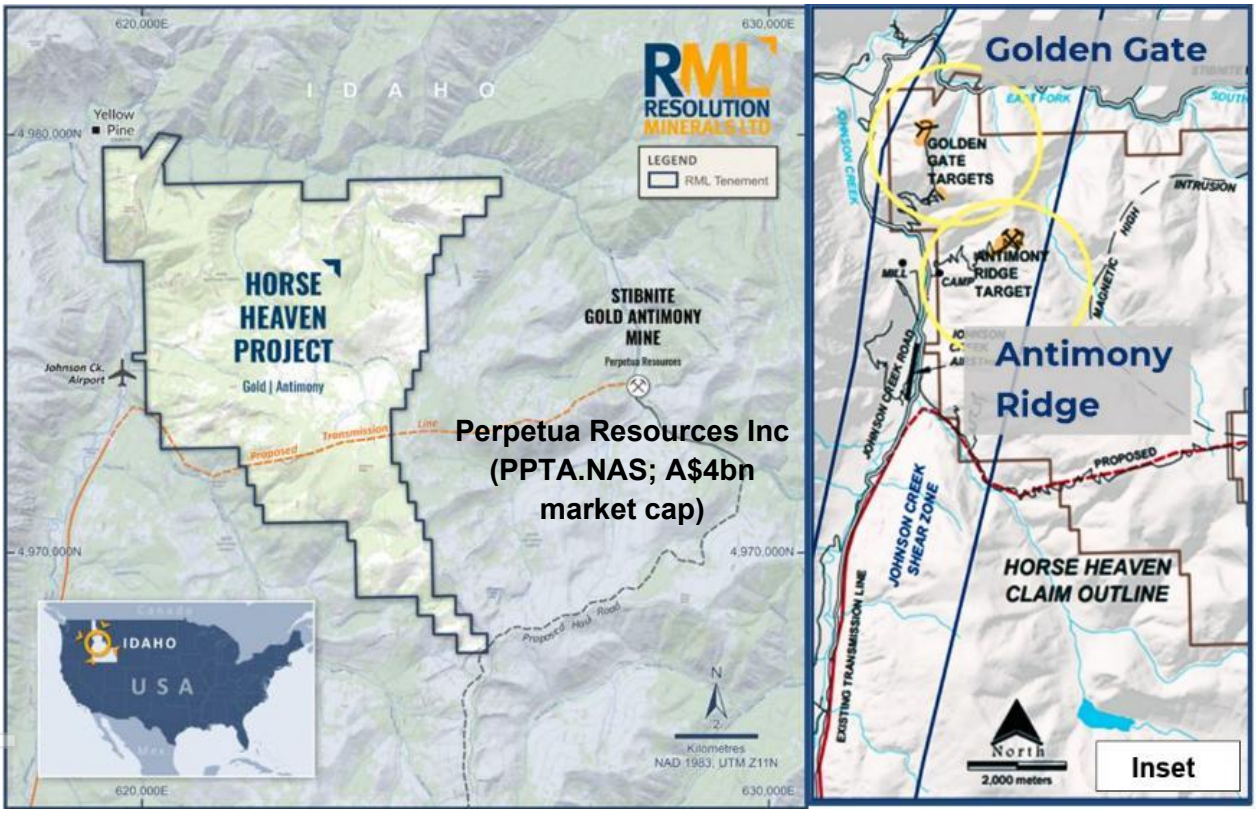

***Figure 1**: Horse Heaven Project location map, highlighting the location of the two current major antimony-gold-silver-tungsten targets, the Golden Gate Target (where the Phase 1 Core Drilling Program was conducted) and the Antimony Ridge Target. Also highlighted is the fully-permitted Stibnite Gold Project, which is only 6km east of Horse Heaven. Note: Coordinates are UTM metres north and east metric system, not latitude/longitude.*

Significant down hole intersections of gold mineralisation in the new holes reported in this announcement include:

HH-GG25-004C:

- **240.8m @ 0.64 g/t gold from surface to EOH 240.8m** (open ended), including:
  - 61.6m @ 0.98 g/t gold from 40.5m; and
  - 35.8m @ 0.83 g/t gold from 119.5m.

HH-GG25-005C:

- **283.5m @ 0.36 g/t gold from surface to EOH 283.5m** (open ended), including:
  - 4.7m @ 1.18 g/t gold from 10.1m;
  - 42.5m @ 0.72 g/t gold from 65.7m;
  - 4.2m @ 1.14 g/t gold from 131.1m; and
  - 4.9m @ 0.76 g/t gold from 176.8m.

HH-GG25-007C:

- **207.2m @ 0.42 g/t gold from surface**, including:
  - 4.45m @ 1.18 g/t gold from 50.7m; and
  - 3.7m @ 2.65 g/t gold from 176.5m.

Hole ID	ASX Announcement Date	Drill Type	Diameter	Drill Hole Location						Dip	Az	EOH (ft)	EOH (m)

***Table 1**: Drill parameters of the HH-GG25-001C, HH-GG25-004C, HH-GG25-005C, and HH-GG25-007C.*

The Company has now reported assay results for six diamond core holes, HH-GG25-001C, HH-GG25-002C, HH-GG25-003C, HH-GG25-004C, HH-GG25-005C, and HH-GG25-007C. These holes, together with HH-GG25-006C, were all drilled in a "cluster" at the northern end of the Golden Gate Project. This area is now known to host an Intrusion-Related gold discovery. Although the mineralisation remains open in all directions, it is convenient to refer to this portion of the prospect as the Golden Gate North Prospect.

HH-GG25-004C

HH-GG25-004C was drilled as a fan hole with HH-GG25-003C (Table 1, Figures 2 and 3). The hole was designed to test for gold mineralisation northeastern of HH-GG25-003C, whilst utilising the same drill platform. At EOH HH-GG25-004 was testing ground approximately 100m northeast of HH-GG25-003C.

Results of HH-GG25-004C confirm that the broad gold mineralisation identified in HH-GG25-003C, continues in an easterly direction (Appendix B). The hole terminated in mineralisation, demonstrating that gold mineralisation remains open to the east.

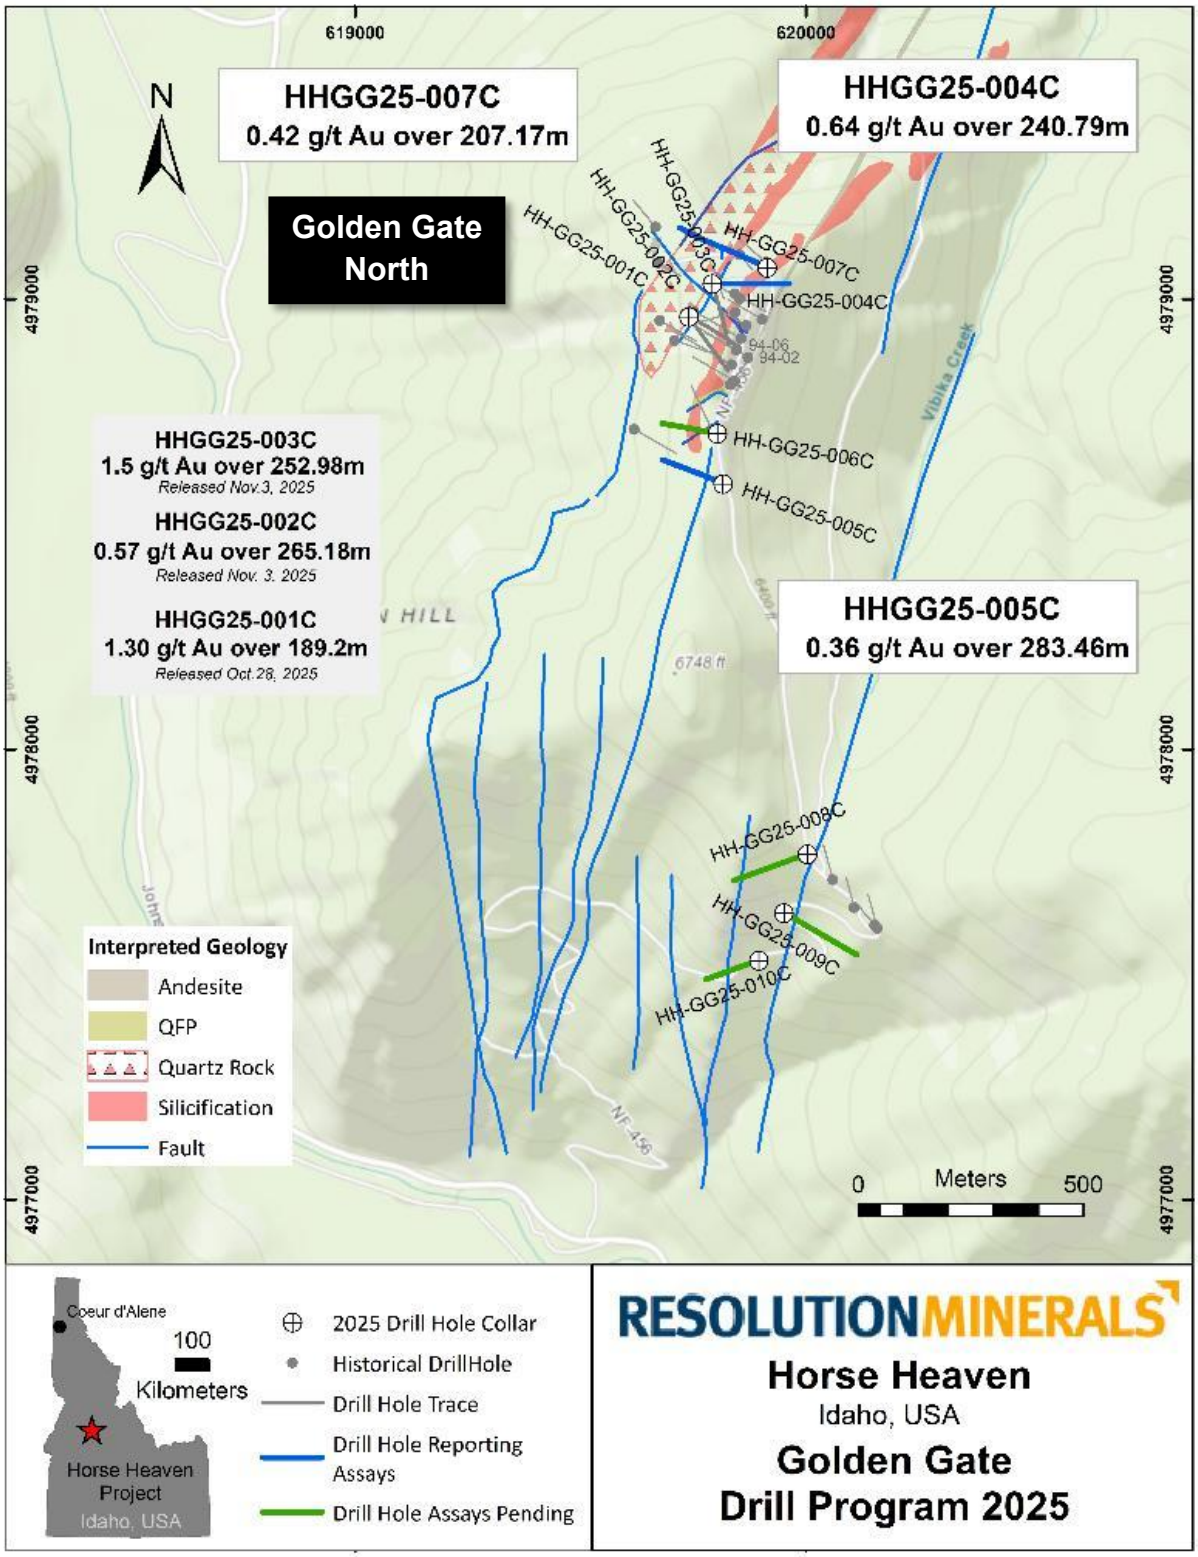

Figure 2: *Drill hole location and simplified geology map of the Golden Gate 2025 drill program of the Golden Gate Prospect. Drill holes HH-GG25-004C, HH-GG25-005C, and HH-GG25-007C are located at the northern part of the Golden Gate Prospect, now referred to as the Golden Gate North Prospect. HH-GG25-005C is the southern most of the 2025 program at Golden Gate North, and HH-GG25-007C is the northern most of the 2025 program at Golden Gate North. They are approximately 500m apart. Refer also to Figure 3.*

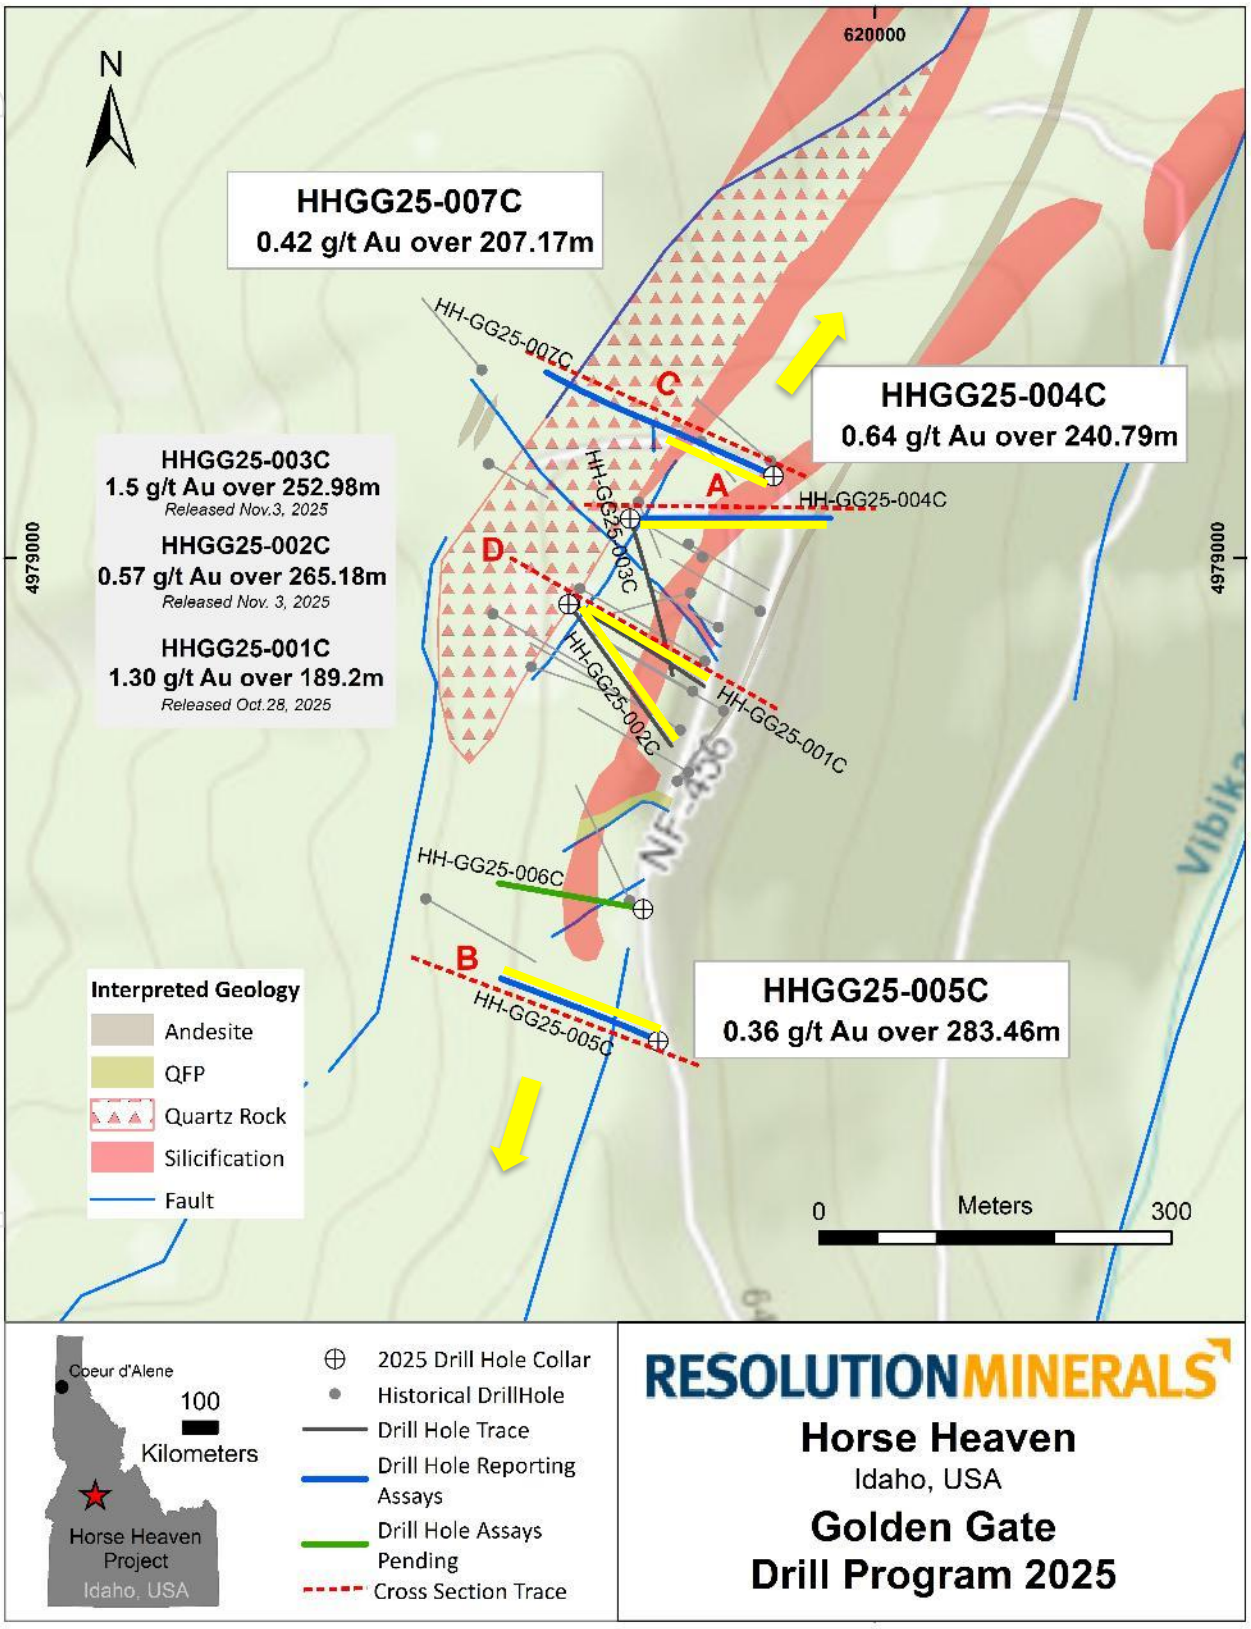

Figure 3: *Drill hole location and simplified geology map of the Golden Gate North Prospect. The gold mineralised intervals are projected to surface and highlighted (solid yellow lines) along the drill stems of the reported holes, HH-GG25-001C, HH-GG25-002C, HH-GG25-003C, HH-GG25-004C, HH-GG25-005C, and HH-GG25-007C. Solid yellow arrows indicate the direction is which the mineralisation is considered open. There is a close spatial relationship with silicification, local faults and lithologies.*

The style of gold mineralisation in HH-GG25-004C is consistent with that observed in HH-GG25-003C. Gold is hosted within altered quartz-sericite to silicified porphyritic monzonite to quartz monzonite and granodiorite. Above the oxide-sulphide boundary, mineralisation is associated with limonite and iron oxides. Below this contact, gold is associated with disseminated pyrite and arsenopyrite as well as quartz-pyrite-arsenopyrite veining (Figure 4). Multiple fault zones, characterised by gouge and breccias, occur within the mineralised interval.

HH-GG25-005C

HH-GG25-005C was drilled 350m south of HH-GG25-001C (Table 1, Figures 2 and 3). The hole was an azimuth parallel to HH-GG25-001C but dips in the opposite direction. The purpose of the hole was to test for gold mineralisation associated with a geophysical resistivity feature at the southern end of the Golden Gate North Prospect (Figures 2 and 3).

The style of gold mineralisation in HH-GG25-005C is consistent with that observed throughout Golden Gate North Prospect. Gold is hosted in altered quartz-sericite to silicified monzonite, quartz-monzonite and granodiorite and is closely associated with pyrite and arsenopyrite (Figure 5, Appendix B).

At depth, HH-GG25-005C intersects strongly calcite altered and brecciated mafic rocks (Figure 5). Notably, these non-intrusive rocks host gold values indicating that mineralisation is not confined to monzonite and granodiorite intrusions. This supports the interpretation that gold is hosted within a shear-zone system affecting both intrusive and sedimentary units.

HH-GG25-007C

HH-GG25-007C was drilled 200m north of HH-GG25-001C (Table 1, Figures 2 and 3) and approximately 100m north of HH-GG25-004C. Like HH-GG25-0005C and HH-GG25-001C, the hole was drilled parallel to the regional structural trend but with opposite dip direction. The purpose was to test for extensions of gold mineralisation toward the northern end of Golden Gate North Prospect.

The style of mineralisation in HH-GG25-005C is consistent with that observed elsewhere across Golden Gate North (Figure 6, Appendix B). Below approximately 135m down-hole, the drillhole intersects a sequence of relatively unaltered andesite dikes and fault breccias marking a contact between the mineralised sequence (quartz-sericite to silicified monzonite, quartz-monzonite and granodiorite) and a late-stage granodiorite-diorite intrusion that is un-mineralised at surface. The presence of this intrusion and/or associated post-mineralisation structural complexity explains the absence of gold mineralisation in the lower portion of HH-GG25-007C (Figure 6).

HH-GG25-001C

Final assays have been received for the lower-most 27.1ft (or 8.3m) of HH-GG25-001C (Figure 7, Appendix B). Gold mineralisation in part of HH-GG25-001C remains open at depth. The revised down-hole interval is **197.5m @ 1.26 g/t from 34.0m**.

Preliminary Interpretation of Golden Gate North Drill Results

The pervasive and consistent gold mineralisation intersected in holes HH-GG25-001C, HH-GG25-002C, HH-GG25-003C, HH-GG25-004C, HH-GG25-005C, and HH-GG25-007C confirms the discovery of a large IRGS at the Golden Gate North Prospect.

The broad intersections of gold mineralisation of HH-GG25-001C, HH-GG25-002C, HH-GG25-003C -GG25-004C, HH-GG25-005C, and HH-GG25-007C are collectively consistent, compatible and confirmatory of the Intrusion Related Gold Systems ("IRGS") Exploration Model of Horse Heaven (ASX announcement dated 11 June 2025, titled "Agreement to Acquire Major Drill-Ready Antimony-Gold-Tungsten Project in Stibnite Mining District, Idaho, USA" and ASX announcement dated 28 October 2025, titled "Near Surface Discovery of 189.2m @ 1.3 g/t gold from 34m, ending in mineralisation."

Intrusion Related Gold Systems are a broad church of mineralisation with many variations in mineralising mechanisms, geological and structural setting, alteration and metal/mineral composition. IRGSs can form large, giant, and supergiant deposits with multimillion ounce resources, including as an example only, in the U.S.: Fort Knox, Pogo, and Donlin Creek; and in Australia: The Granites, Telfer, Hemi, and Kidston.

All holes for which assay data is currently available, HH-GG25-001C, HH-GG25-002C, HH-GG25-003C -GG25-004C, HH-GG25-005C, and HH-GG25-007C (six of the seven diamond drill core holes) drilled at Golden Gate North Prospect contain significant down hole intervals of gold mineralisation.

The broad mineralised intersections of these holes include:

- **HH-GG25-001C: 197.5m @ 1.26 g/t gold from 34.0m (open ended);**
- **HH-GG25-002C: 265.2m @ 0.60 g/t gold from surface (open ended);**
- **HH-GG25-003C: 253.0m @ 1.50 g/t gold from surface (open ended);**
- **HH-GG25-004C: 240.8m @ 0.64 g/t gold from surface (open ended);**
- **HH-GG25-005C: 283.5m @ 0.36 g/t gold from surface (open ended); and**
- **HH-GG25-007C: 207.2m @ 0.42 g/t gold from surface.**

Broad, continuous gold mineralisation has now been identified in diamond drill holes located approximately 600m apart (HH-GG25-007C to the north, and HH-GG25-005C to the south). Mineralisation is interpreted to be hosted within the Golden Gate shear zone, a regional NNE striking, steeply dipping strike-slip fault zone. Higher grade intervals observed in most drillholes may represent mineralised shoots developed within wider broad zones of lower-grade gold, an established characteristic of shear-zone hosted gold systems.

Gold mineralisation remains open along strike to the north, south and east and is open at depth. Historical data indicate potential for mineralisation to extend a further ~750m to the north along strike, as far as the East Fork, South Fork Salmon River. Cross-sections interpretations support this view, with five of the six reported holes ending in mineralisation, reinforcing the open-ended nature of the system at depth.

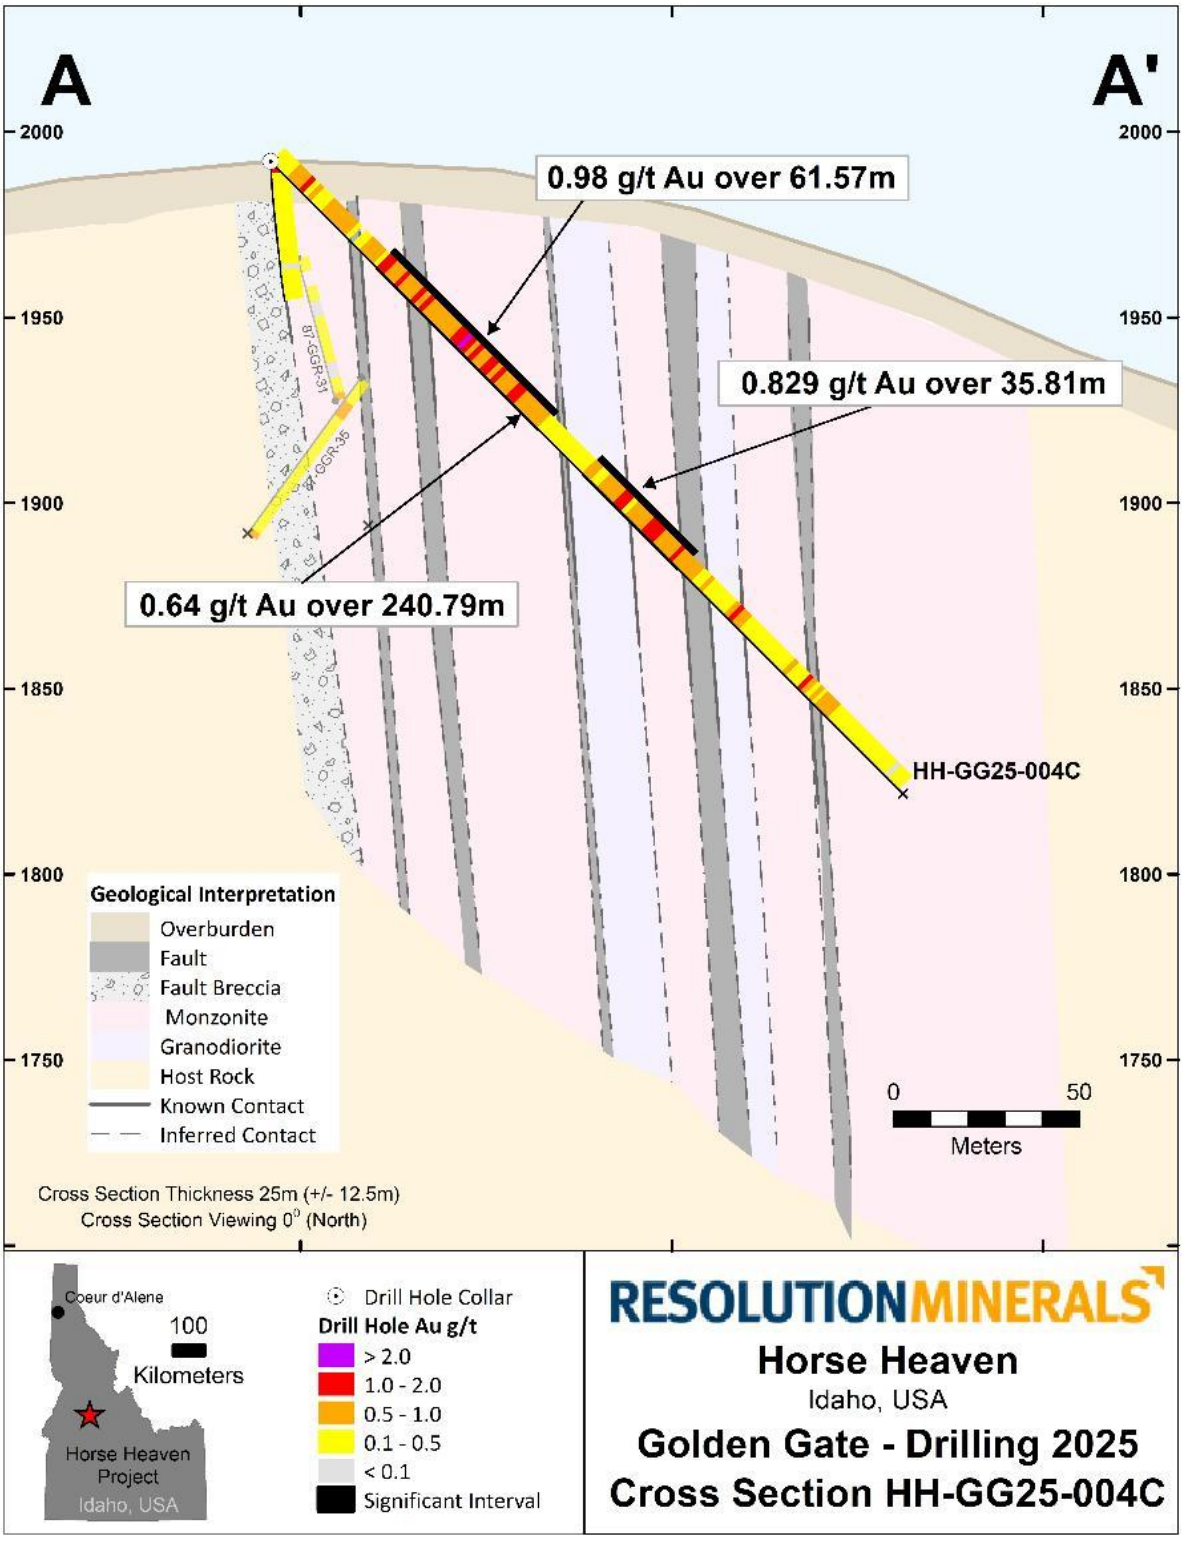

Figure 4: *Schematic cross section of HH-GG25-004C showing the local geology, highlighting the significant gold intersections, and pre-RML RC drill holes intersections draw into the plane of the cross section. The cross section shows how the pervasive gold mineralisation of HH-GG25-004C traverses a repeating sequence of near-vertical fault breccias, within a structurally-bound monzonites and granodiorites.*

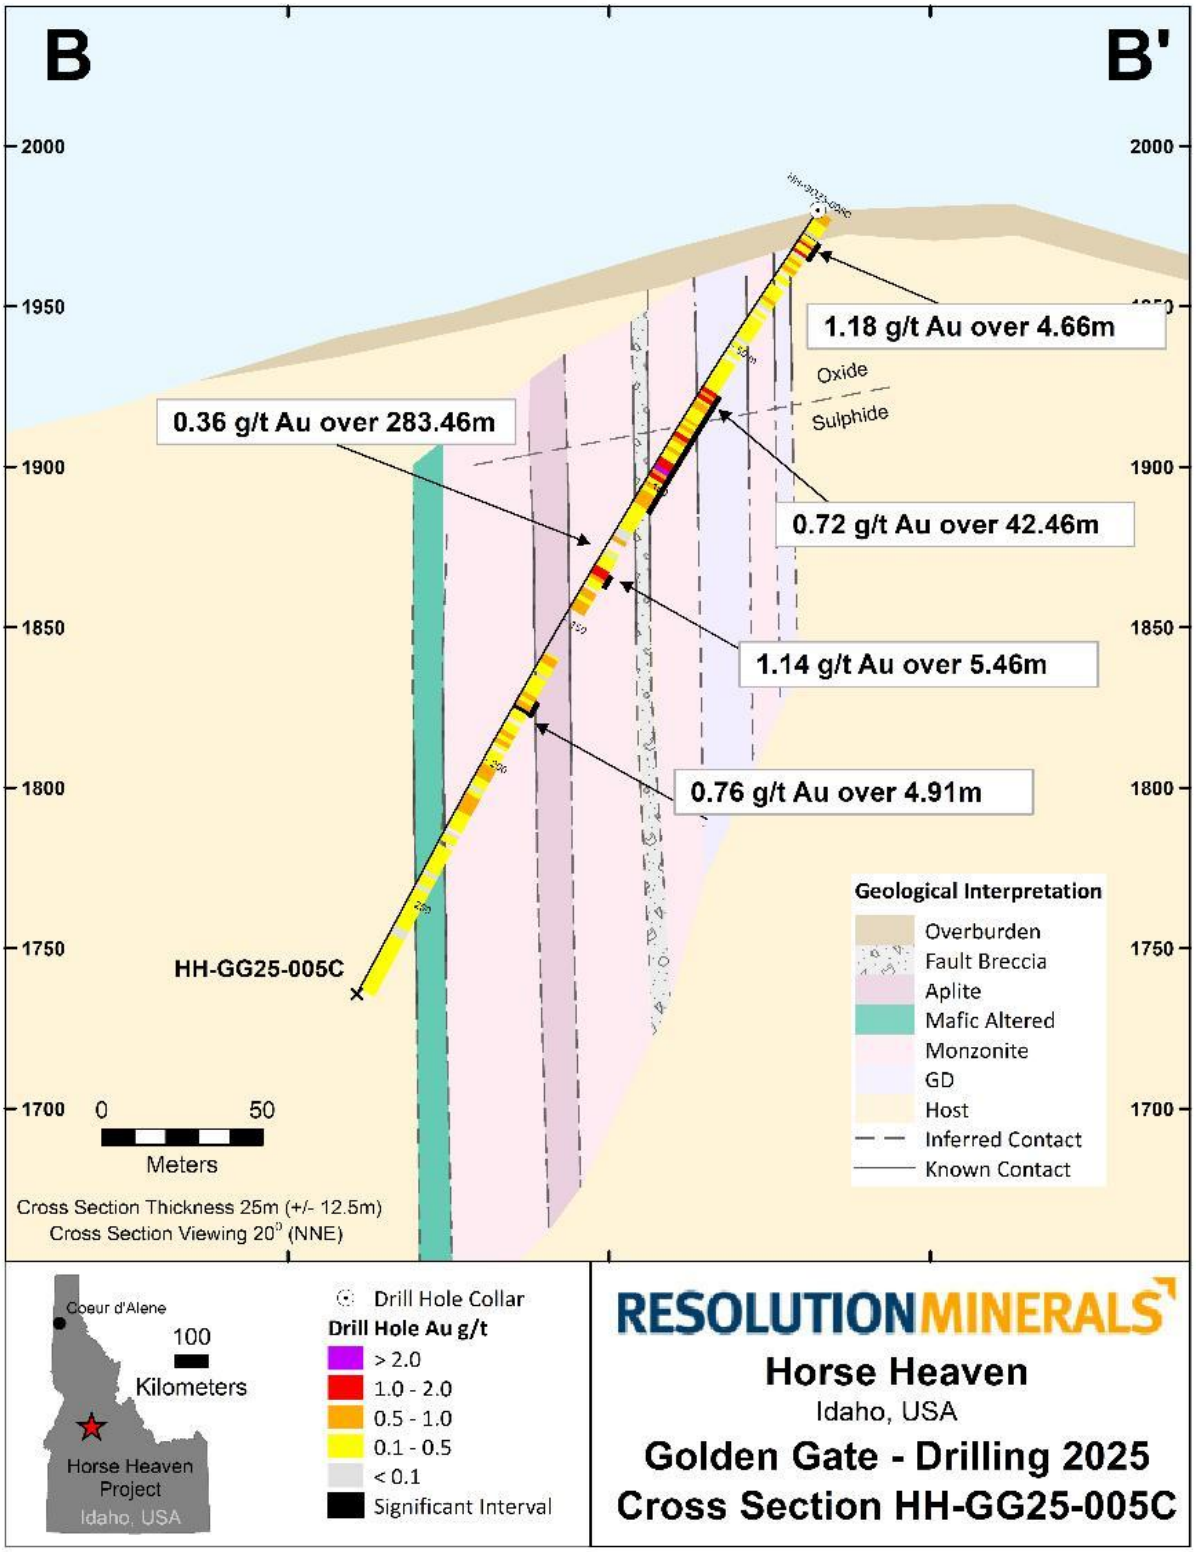

Figure 5: *Schematic cross section of HH-GG25-005C showing the local geology, highlighting the significant gold intersections, and pre-RML RC drill holes intersections draw into the plane of the cross section. The cross section shows how the pervasive gold mineralisation of HH-GG25-004C traverses a repeating sequence of near-vertical fault breccias, within a structurally-bound monzonites (with the granodiorite as the "host" as described in the legend).*

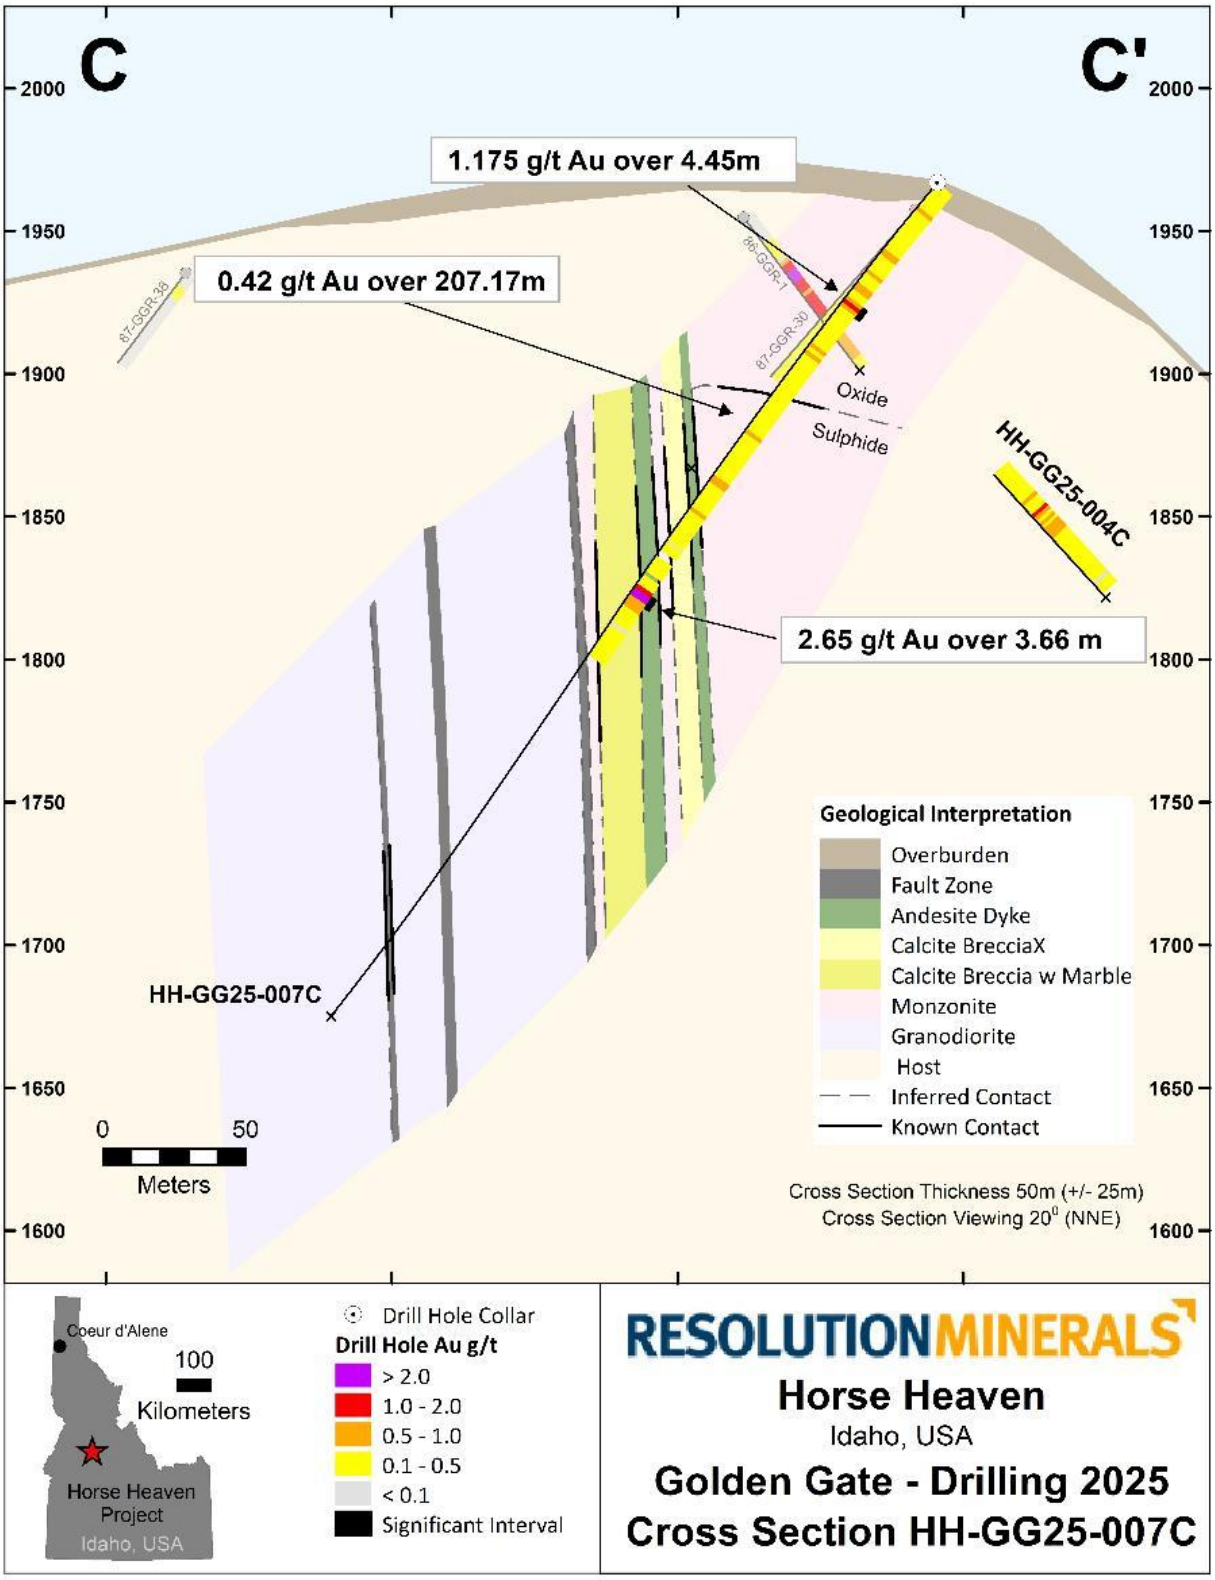

Figure 6: *Schematic cross section of HH-GG25-007C showing the local geology, highlighting the significant gold intersections, and pre-RML RC drill holes intersections draw into the plane of the cross section. The cross section shows how the pervasive gold mineralisation of HH-GG25-007C traverses a repeating sequence of near-vertical fault and fault-calcite breccias, within a structurally-bound monzonites and granodiorites. The lower half of HH-GG25-007C enters into a late-stage un-mineralised granodiorite intrusion.*

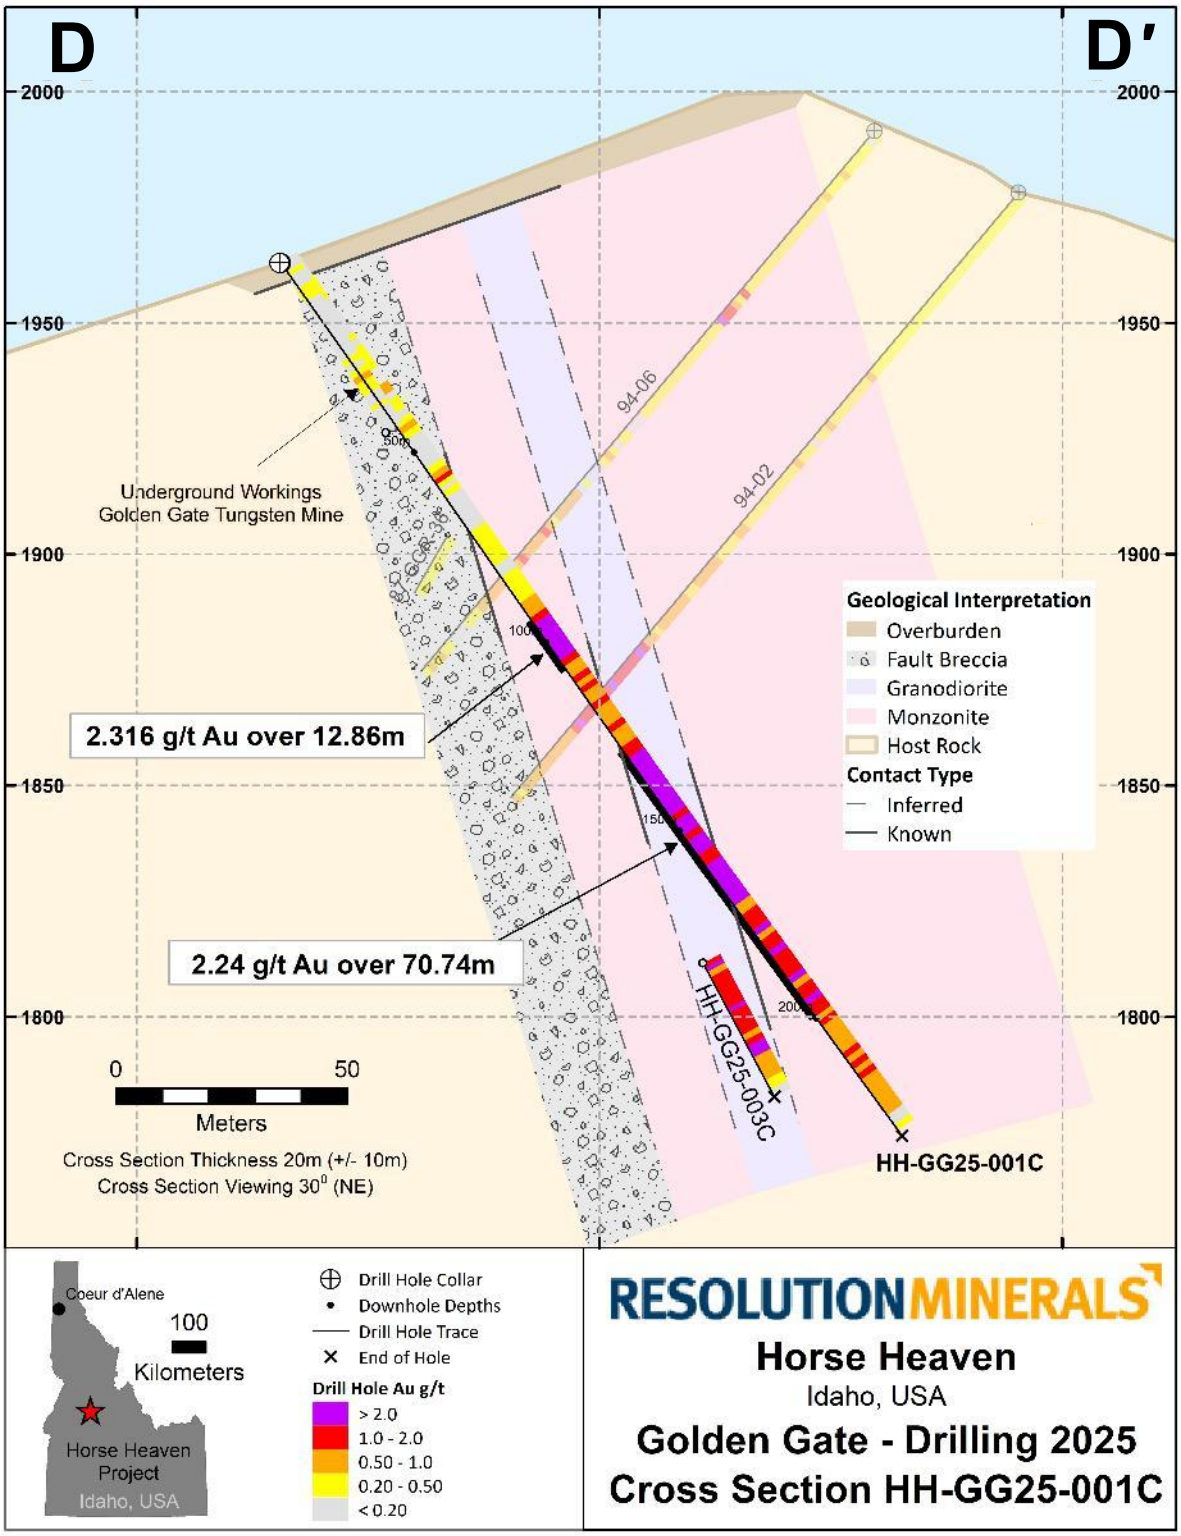

Figure 7: *Schematic cross section of HH-GG25-001C showing the local geology, highlighting the significant gold intersections, and pre-RML RC drill holes intersections draw into the plane of the cross section. The cross section shows how the pervasive gold mineralisation of HH-GG25-001C is primarily associated with an expansive monzonite and granodiorite intrusion.*

Next Assays Update

Resolution has completed its 10-hole Phase-1 diamond core drill program at Golden Gate, with all holes logged and sampled. This announcement reports results from the third batch of core samples, for HH-GG25-004C, HH-GG25-005C, HH-GG25-007C and the bottom of HH-GG25-001C).

Assay results for HH-GG25-006C (the final diamond core hole of Golden Gate North) are imminent.

Assay results for HH-GG25-008C to HH-GG25-010C (holes all drilled in the southern part of Golden Gate) will be available sequentially over the next few months.

RML's Lead Geologist, Austin Zinsser stated:

> "The additional drill results from Golden Gate North, especially the step out hole to the south, demonstrate extension of the system well beyond historical drilling, and support the definition of a significant intrusion related gold system with multiple similarities to those at Perpetua's Stibnite Gold Project."

Next Steps

Resolution will be releasing results from the final four holes of its ten-hole core drilling program and results from three shallow follow-on reverse circulation drill holes as they become available. The Company will also be submitting samples from its maiden drill program for initial metallurgical testing.

In 2026, Resolution plans to follow up on its successful 2025 program by completing approximately 45 additional holes at Golden Gate, taking the total planned 57 holes for ~45,000 feet (13,700 meters) of drilling. This planned program will cover approximately 2.5km of the known 3.0km strike length of the Golden Gate target.

Authorised for release by the board of Resolution Minerals Ltd.

Competent Person's Statement

The information in this report that relates to exploration results, is based on and fairly represents information reviewed and compiled by Mr Ross Brown BSc (Hons), M AusIMM, Principal Geologist/director of exploration consulting firm, Riviere Minerals Pty. Ltd, who is a Member of the Australasian Institute of Mining and Metallurgy. Mr Brown has sufficient experience, which is relevant to the exploration activities, style of mineralisation and types of deposits under consideration, and to the activity which has been undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Riviere Minerals is consulting to Resolution Minerals Ltd and consents to the inclusion in this announcement of the matters based on their information in the form and context in which it appears.

The Company confirms it is not aware of any new information or data that materially affects the information cross referenced in this announcement and "Significant Gold Discoveries Continue at Golden Gate" on 3 November 2025. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original announcements.

About Rivere Minerals

*Riviere Minerals Pty Ltd ("**Riviere**") is a resource consultancy specialising in project evaluation and portfolio management. Its principal geologist and sole director, Mr Ross Brown, has nearly 40 years of experience in mineral exploration worldwide. Through Riviere, Mr Brown also provides assistance in exploration planning, execution and ASX reporting.*

Forward Looking Statements

This announcement may contain forward-looking statements. These statements relate to the Company's expectations, beliefs, intentions or strategies regarding the future. These statements can be identified by the use of words like "anticipate", "believe", "intend", "estimate", "expect", "may", "plan", "project", "will", "should", "seek" and similar words or expressions containing same. These forward-looking statements reflect the Company's views and assumptions with respect to future events as of the date of this release and are subject to a variety of unpredictable risks, uncertainties, and other unknowns. Actual and future results and trends could differ materially from those set forth in such statements due to various factors, many of which are beyond our ability to control or predict. These include, but are not limited to, risks or uncertainties associated with the acquisition and divestment of projects, joint venture and other contractual risks, metal prices, exploration, development and operating risks, competition, production risks, sovereign risks, regulatory risks including environmental regulation and liability and potential title disputes, availability and terms of capital and general economic and business conditions.

Given these uncertainties, no one should place undue reliance on any forward-looking statements attributable to the Company, or any of its affiliates or persons acting on its behalf. Subject to any continuing obligations under applicable law, the Company disclaims any obligation or undertaking to disseminate any updates or revisions to any forward-looking statements in this announcement to reflect any change in expectations in relation to any forward-looking statements or any change in events, conditions or circumstances on which any such statement is based.

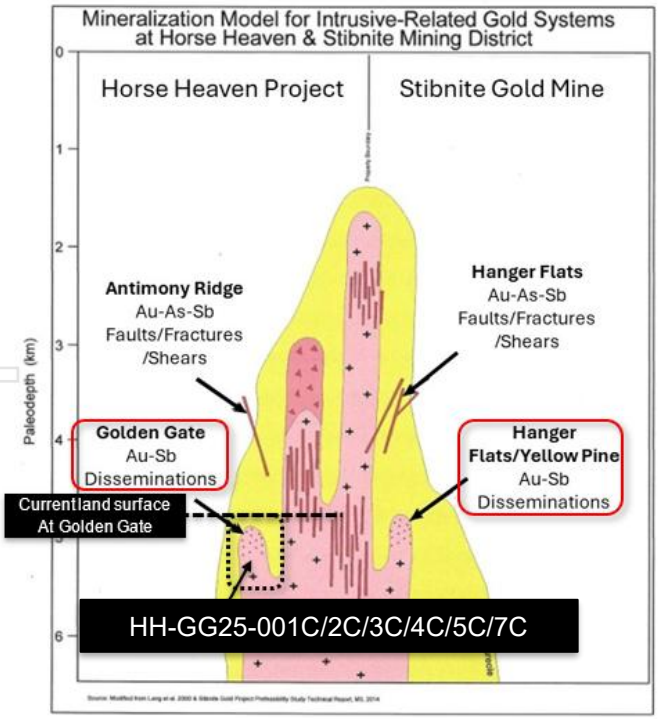
Appendix A: Intrusion Related Gold Systems, A Horse Heaven / Stibnite Deposit Exploration Model-based Comparison.

The broad intersections of gold mineralisation of HH-GG25-001C, HH-GG25-002C, HH-GG25-003C -GG25-004C, HH-GG25-005C, and HH-GG25-007C are collectively consistent, compatible and confirmatory of the Intrusion Related Gold Systems ("IRGS") Exploration Model of Horse Heaven (ASX announcement dated 11 June 2025, titled "Agreement to Acquire Major Drill-Ready Antimony-Gold-Tungsten Project in Stibnite Mining District, Idaho, USA" and ASX announcement dated 28 October 2025, titled "Near Surface Discovery of 189.2m @ 1.3 g/t gold from 34m, ending in mineralisation".

Intrusion Related Gold Systems are a broad church of mineralisation with many variations in mineralising mechanisms, geological and structural setting, alteration and metal/mineral composition. IRGSs can form large, giant, and supergiant deposits with multimillion ounce resources, including as an example only, in the U.S.: Fort Knox, Pogo, and Donlin Creek; and in Australia: The Granites, Telfer, Hemi, and Kidston.

Of particular relevance to Horse Heaven is the Stibnite Mine deposit, located only 6km east of Horse Heaven. It is another example of an IRGS (intrusive hosted and structurally controlled gold deposit). The gold mineralisation at Stibnite has not been discretely categorised but is noted to share similarities with both reduced intrusion systems and Carlin-type gold deposits. **Golden Gate is believed broadly analogous at the Stibnite deposits. Gold mineralisation at both Golden Gate and Stibnite is localised by northerly fault systems; hosted by felsic intrusive rocks of the Idaho batholith, associated with fine-grained sulphides, sericite alteration, biotite replacement and quartz-pyrite-arsenopyrite veining.**

The pervasive nature of the gold mineralisation with low levels of disseminated pyrite and arsenopyrite in an altered monzonite and granodiorite in HH-GG25-001C/2C/3C is reminiscent of IRGS's. Using the Lang (2000) schematic section of an IRGS. The interpreted projected position of HH-GG25-001C is possibly into a structurally prepared zone associated with the Johnson Creek shear zone, where IRGS disseminated gold mineralisation distal or lateral to the causative intrusion has been localised. By extension of the Lang IRGS – Horse Heaven/Stibnite Mine comparison model (App A-Figure 1), it follows that the Golden Gate Prospect exhibits similarities in terms of: i) host rock, ii) gold mineralisation, iii) associated disseminated sulphides, and iv) localisation along north striking shear zones to the Stibnite Mine Hanger Flats-Yellow Pine gold deposits.



***Appendix A Figure 1**: Schematic IRGS cross section showing the relative positions of the Stibnite Mining District Hanger Flats and Yellow Pipe deposits (Right half) and the Antimony Ridge and Golden Gate prospects (Left half). This cross section is modified from Lang et al 2000. A possible drill hole projection of HH-GG25-001C/2C/3C is highlighted and a hypothetical current land surface level relative to the IRGS.*

Appendix C: JORC Code, 2012 Edition

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• This announcement contains exploration results of four drill holes with the ID references HH-GG25-004C, HH-GG25-005C, HH-GG25-007C and HH-GG25-001C (part thereof). • The data is: drill hole data; sample data; assay data; and geological data. Supporting data includes drill collar locations in UTM metric data, together with dip, azimuth, altitude and end of hole data. • Tabulated assay data is gold, silver, tungsten. The Company has completed multi-element analysis and has referred to tungsten geochemistry. • Assay data commentary is for gold only. • Please note that the primary data of the core samples (start, finish, interval) were converted from imperial feet measurements to metric metres in this announcement. Note that the operating jurisdiction uses imperial measurement system. • The assay data is derived independent professional laboratory services company of submitted core samples from HH-GG25-004C, HH-GG25-005C, HH-GG25-007C and HH-GG25-001C. • HH-GG25-004C, HH-GG25-005C, HH-GG25-007C and HH-GG25-001C are diamond core holes. Sample intervals are contiguous and range in length individually from 2.3ft to 10.5ft (averaging ±4.5ft). The samples are half-cut core prepared by industry standard core cutting saw by qualified personnel. • Samples were taken for the majority of the hole depth except where rock voids were encountered. • Geological data is derived from detailed geological and geotechnical logging by qualified personnel.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-*	• HH-GG25-004C, HH-GG25-005C, HH-GG25-007C and HH-GG25-001C are diamond core drill holes that was drilled by Evolve Exploration Ltd using a Multipower

Criteria	JORC Code explanation	Commentary
	sampling bit or other type, whether core is oriented and if so, by what method, etc).	MP500 modular core rig providing HQ diamond drill core. • The drill core is not oriented.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• Drill core recovery of HH-GG25-004C, HH-GG25-005C, HH-GG25-007C and HH-GG25-001C was variable depending on the ground conditions (a function of the solid lithologies) from 30% over short intervals to 100%.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• Drill core was logged for lithology, alteration, mineralization, structure (geotechnical) using oriented core to a level which has enabled preliminary interpretations relating to style of mineralisation, host and thickness. At this stage no Mineral Resource Estimates, mining studies or metallurgical studies are appropriate. • Drill core is also logged for RQD and Core recovery. • Drill core is then digited photographed wet and dry while whole after logging. • The logging, as described above is both quality and quantitative. • 100% of the relevant intersections were logged as per above.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.*	• The HQ core was halved using a diamond core saw and sampled on geological intervals approximating 2.5 ft to 10.4 ft in length. • Drill core was halved using a gasoline powered core saw by RML contract staff who maintain possession of the core at its Antimony Camp facility. • Half-cut core samples were bagged and tagged using bar-coded sample tags and were securely stored prior to shipment at the Antimony Camp facility. • Half cut core samples were transported by RML contractors under lock and key to ALS prep' lab' facility in Twin Falls, ID. No third-party shippers were involved in the shipping process; chain of custody forms

Criteria	JORC Code explanation	Commentary
	• *Whether sample sizes are appropriate to the grain size of the material being sampled.*	were exchanged at ALS Minerals in Twin Falls and a copy kept on file. The remaining boxed cut core are kept at a secure locked facility in Donnelly, ID. • ALS Minerals Twin Falls prep' lab' logs in the samples using the sample tag bar codes provided. Samples were then crushed to 70% less than 2mm, rotary split off 250g, pulverise split to better than 85% passing 75 microns. • All samples were then shipped to ALS Minerals analytical laboratory in Vancouver, British Columbia.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.*	• Gold was assayed by analytical method Au-AA23: Au by fire assay and AAS 30g nominal sample weight. • Multielement analysis was by analytical method ME-ICP61: 34 elements by HF-HNO3-HClO4 acid digestion, HCl leach and ICP-AES. Quantitatively dissolves nearly all elements for the majority of geological materials. Only the most resistive minerals, such as Zircons, are only partially dissolved. • No geophysical tools, spectrometers, handheld XRF instruments, etc.. were used in the generation of the assay data. • Certified reference materials (CRM) from an ISO certified supplier were inserted randomly into the sample stream at a ratio of 2%. CRMs were obtained for Meg LLC of Reno, Nevada; two separate CRMs were used for gold: a low grade and high-grade standard. • Blank material was inserted randomly in the sample stream at a ratio of 2%. Blank material is commercially available pea-gravel that has been previously tested for gold concentrations. • Duplicates samples were collected by quarter cutting the core at randomly selected intervals. Two quarter-cut portions of core were sent for analysis; the remaining half is kept at a secure facility. Core intervals of poor recovery were not used for duplicate samples. Duplicate core samples were inserted into the sample stream at a ratio of 2%.

Criteria	JORC Code explanation	Commentary
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• No verification of the *significant intersections by either independent or alternative company personnel* has been completed to date. The company acknowledges the material nature of the results and is planning a program of select verification assays. Such were the immediacy of the results; these verifications were not possible prior to the release of the [initial/first] results. The Company is confident that its sample security processes are adequate for the interim period. • The announcement details drill holes HH-HH-GG25-004C, HH-GG25-005C, HH-GG25-007C and HH-GG25-001C. Note that HH-GG25-004C was drilled on the same platform as HH-GG25-003C but drilled in a different direction (Figure 3). By this HH-GG25-004C and HH-GG25-003C are fanned holes. • Sample results, certificates and results were sent via email to RML site contractors in Antimony Camp where results are analysed and interpreted. • No assay adjustments have been carried out.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• The drill hole locations were achieved using handheld GPS programmed into the local coordinate system. The accuracy of the GPS is in line with best practice standards.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• The assay data spacing of HH-GG25-004C, HH-GG25-005C, HH-GG25-007C and HH-GG25-001C, the length and frequency of each sample and the collective coverage of the drill holes are best practise in terms of hole sample representativeness. • In terms of geological data spacing associated with HH-GG25-004C, HH-GG25-005C, HH-GG25-007C and HH-GG25-001C every metre of the holes were logged.
Orientation of data in relation to	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.*	• The drill holes have a drill direction that is approaching perpendicular to the regional trend (lithologically and structurally) and also approaching perpendicular to the known mineralisation of a historical

Criteria	JORC Code explanation	Commentary
geological structure	• *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	tungsten mine. The purpose of the holes was to test the occurrence of known tungsten mineralisation at surface at depth, and to test the occurrence of gold in un-oxidised rocks at depth. • Cautionary Note: There is currently insufficient data pertaining to sampling orientation and the local-scale orientation of mineralisation to determine the true width of the gold intervals in these holes. Additional holes in all directions are required to determine whether the gold mineralisation is broadly pervasive or (to various degrees) spatially constrained. For example, if the gold mineralisation is broadly pervasive, then the gold intervals in this announcement are true widths. If the gold mineralisation is spatially constrained, then the gold intervals in this announcement are not true widths. Based in increasing data, the gold mineralisation is interpreted as being broadly pervasive in association with a structurally-controlled repeating host sequence of country-rock granites and fault breccias.
Sample security	• *The measures taken to ensure sample security.*	• All drill core samples were delivered directly to RML's geologists on site where they remain under direct supervision at a secure site.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• The competent person is unaware of the undertaking of audits or reviews for sampling technique and data, other than its own review.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, past sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• This announcement refers to the one project, Horse Heaven project in Idaho USA, comprising six hundred and ninety-nine (699) U.S. Federal lode mining claims covering 5,644 hectares and includes six hundred and eighty-nine (689) mining claims and ten lode mining claims referred as the Oberbillig Group. • The competent person understands that the mining claims are all in good standing.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• No exploration results reported in this release were performed by other parties.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The project area is dominated by Cretaceous-aged granitic rocks relating to intrusive phases associated with the Atlanta Lobe of the Idaho Batholith. These largely granodiorite rocks have intruded Neoproterozoic-aged metasediments, comprising quartzites (which are dominant) calc-silicates, marble and black shale. The area and broader region are affected by broad reginal folding and N-S, NNE-SSW, and NE-SW faults. • Gold, antimony, tungsten and silver mineralisation is associated with hydrothermally altered and fractured granodiorites.

Drillhole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drillholes:*
	  ○ *easting and northing of the drillhole collar*
	  ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drillhole collar*
	  ○ *dip and azimuth of the hole*
	  ○ *down hole length and interception depth*
	  ○ *hole length.*
		• The drillhole information for HH-GG25-004C, HH-GG25-005C, HH-GG25-007C and HH-GG25-001C, are included in an in-text table (Table 1) with drill collar location data, altitude, dip, azimuth, and end of hole.

Criteria	JORC Code explanation	Commentary
	• *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• In reporting downhole gold intersections results of HH-GG25-004C, HH-GG25-005C, HH-GG25-007C and HH-GG25-001C, no maximum and minimum truncations were used. • In reporting downhole gold intersections/intervals, assay results of HH-GG25-002C and HH-GG25-003C, weighted averages were required due to the fact that sample lengths were variant (between 2.2ft and 5.2ft). The sample interval length was multiplied by the sample assay data then divided by the total length of the interval. • No metal equivalents were used in this announcement.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drillhole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• With reference to HH-GG25-004C, HH-GG25-005C, HH-GG25-007C and HH-GG25-001C, the holes were drilled close to perpendicular across the prospect-scale orientation of the known mineralisation. • **There is insufficient data pertaining to the gold mineralisation identified in HH-GG25-004C, HH-GG25-005C, HH-GG25-007C and HH-GG25-001C, to allow conclusive statements concerning the sampling orientation and the local-scale orientation of mineralisation. Therefore the true width nature of the reported widths of the mineralisation (in rock chip channel and drilling) is not known.**
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drillhole collar locations and appropriate sectional views.*	• A map and a cross section are provided with geolocation information (coordinates, northing and scale bar). Legends are included within each figure (where appropriate) and when additional explanation is required, this is given to the figure caption.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be*	• This announcement is considered to be fair and balanced with respect to the

Criteria	JORC Code explanation	Commentary
	practiced to avoid misleading reporting of Exploration Results.	exploration results and interpretations based on them.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• There is no other material data associated with new exploration results in this announcement.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• The drill holes subject of this announcement, HH-GG25-004C, HH-GG25-005C, HH-GG25-007C and HH-GG25-001C, are part of the 10-hole diamond core program, which as the announcement reports, Is completed. Drill hole data of HH-GG25-006C and HH-GG25-007C through to HH-GG25-010C will be released to the market upon receipt. • Plans (Figures 2 and 3) and a cross sections (Figures 4, 5, 6 and 7) are included in this announcement to provide a sense of location of the hole in relation: to i) other drill holes; and ii) intersected mineralisation. The cross sections include a geological interpretation.
