

## DISCOVERY OF SURFACE IONIC ADSORPTION REE MINERALISATION AT EAST SALINAS

### HIGHLIGHTS:

- Initial assay results from diamond drilling at the East Salinas Project confirms rare earth element (REE) ionic adsorption (IAC) style enrichment within thick surface saprolite that are amenable to IAC<sup>1</sup> leaching
- Assay results have been received from the first four diamond holes of a 14-hole program, returning multiple intercepts of TREO<sup>2</sup> and NdPr<sup>3</sup> ratio within saprolite:
  - 12m @ 2,741ppm TREO and 23% NdPr from surface (EAS-DD-0001)
  - 8m @ 1,482ppm TREO and 22.1% NdPr from surface (EAS-DD-0002)
  - 13m @ 1,654ppm TREO and 16.8% NdPr from surface (EAS-DD-0003)
  - 7m @ 3,467ppm TREO and 21.5% NdPr from surface (EAS-DD-0004)
  - Peak grade of 5,058ppm TREO @ 25% NdPr from 1 - 2m (EAS-DD-0004)
- Drill core shows consistent weathering profile in saprolite trending over 4 kilometres which are underlain by the Medina Intrusive Granite Complex, comparable with other true IAC mineralisation which is derived from granite sources such as the operating Serra Verde Rare Earth Mine
- The maiden drill program was overseen by Enova's geologist Fernando Moya who previously was the geology manager at Serra Verde.
- A total of 14 diamond drillholes were completed across four target areas, generating 1,134 samples
- Surface saprolite was intersected in all drill holes, with thicknesses ranging between 8 to 25m. Saprolite samples from remaining holes will be submitted for assay and IAC leach testing over the coming week
- Enova will also begin preparations for a deep diamond program at Charlie Creek, testing to follow up previous >1% TREO grade mineralisation that remained open at depth where air-core drilling was unable to reach fresh bedrock

**Enova Mining Limited (ASX: ENV) (Enova or the Company)** is pleased to announce results from its recent diamond drilling program at East Salinas, Brazil, where drilling **intersected encouraging rare earth elements (REE) mineralisation from surface**, confirming the presence of an intrusive hosted REE mineral system.

<sup>1</sup> Ionic Adsorption Clays

<sup>2</sup> TREO: Total Rare Earth Oxide plus Y<sub>2</sub>O<sub>3</sub> ppm (1%TREO=10000 ppm TREO)

<sup>3</sup> Total Rare Earth Oxide (TREO) and Neodymium-Praseodymium Oxide Ratio

Results received to date demonstrate the pervasive nature of mineralisation across rock units. Further assay results from the remaining core required to better define the grade distribution and identify zones higher grade mineralisation.

The assays confirm **continuity of REE mineralisation at depth and support the Project's** association with **magnetic REE potential identified in previous geochemical surveys**. These results reinforce East Salinas as a priority target for ongoing exploration and further drilling.

**Enova Mining CEO / Executive Director Eric Vesel** commented:

*"The East Salinas drilling program was designed as an initial test of rare earth mineralisation identified in surface sampling, and the results have materially improved our understanding of the system. Drilling has confirmed that the strongest REE enrichment occurs within surface saprolite clays, with mineralisation present across all holes drilled to date.*

*The consistency and thickness of the saprolite intersected across targets spaced over approximately four kilometres suggests the potential for broad scale saprolite coverage. Initial IAC leach test results indicate that the surface clays are amenable to low intensity processing, supporting the potential for a lower cost development pathway.*

*These results allow the Company to progress the targeted auger drilling to define the extent of saprolite mineralisation and further assess metallurgical performance. The identification of ion adsorption style mineralisation at surface provides Enova with a clear and systematic pathway for advancing the East Salinas Project."*

### **Rare earth grades confirm mineralisation**

Assay results have been received from 295 drillhole core samples analysed by SGS Geosol Laboratory. Samples were collected from granite and granodiorite suites at Bald Hill and Naked Hill within the Medina Intrusive Complex. The results increase geological confidence in the presence of intrusive hosted REE mineralisation at depth and will inform the planning of future resource delineation drilling programs.

The recent diamond drilling program comprised 14 holes for a total of 989.63 metres, with 1,134 core samples collected across multiple target areas including Bald Hill, Naked Hill, Hairy Hill and Flat Hill. Drilling was designed to test the extent and continuity of REE mineralisation across the Medina Intrusive Complex.

| Hole type    | Target     | Number of holes | Meterage      | Number of    | Hole Depth    |
|--------------|------------|-----------------|---------------|--------------|---------------|
| Diamond      | Bald hill  | 2               | 150.07        | 169          | Refer Table 3 |
| Diamond      | Naked      | 6               | 502.14        | 577          |               |
| Diamond      | Hairy Hill | 3               | 191.97        | 220          |               |
| Diamond      | Flat Hill  | 3               | 145.45        | 168          |               |
| <b>Total</b> |            | <b>14</b>       | <b>989.63</b> | <b>1,134</b> |               |

Table 1: Total drilling statistics in East Salinas

Core drill samples from the East Salinas Project returned multiple high-grade rare earth results, with several assays exceeding 1,000 ppm total rare earth oxides (TREO) (Figure 1). Key intercepts in saprolite include:

- **12m@ 2,741ppm TREO and 23% NdPr from surface (EAS-DD-0001)**
- **8m@ 1,482ppm TREO and 22.1% NdPr from surface (EAS-DD-0002)**
- **13m@ 1,654ppm TREO and 16.8% NdPr from surface (EAS-DD-0003)**
- **7 m @ 3,467 ppm TREO and 21.5% NdPr from surface (EAS-DD-0004)**

### Progress at East Salinas

Drillhole lithological data from the East Salinas Project indicate strong geological continuity along multiple intrusives bodies at the Naked Hill, Bald Hill, Hairy Hill and Flat Hill targets (Figure 1). The results support the interpretation that these targets are part of a larger, coherent intrusive body within the Medina Granitic Complex.

Drilling has intersected consistent lithologies and mineralised intervals across several intrusives, suggesting that surface outcrops represent exposed portions of a more extensive rare earth bearing system at depth. This interpretation supports the ongoing exploration strategy, which integrates geophysical data, hyperspectral analysis and targeted drilling to assess the scale, geometry and continuity of mineralisation across the project area.

Figure 1: Diamond drillholes completed shown above

## Drilling and Sampling

Enova Brazilian exploration team on site alongside the drilling crew, positioned in front of the active diamond drill rig and associated support infrastructure. The image highlights a well organised, safety focused operation, reflecting strong coordination between Enova personnel and local contractors, stakeholders during the drilling campaign (Figure 2).

Active diamond drilling operations, with the drill rig, core handling area, and support equipment arranged in a controlled and well managed work zone. Drill core trays in the foreground highlight systematic sample recovery and logging procedures underway at the site-managed work zone (Figure 3).

Figure 2: Enova's Brazilian team and driller in East Salinas

Figure 3: Diamond drill rig at hole number EAS-DD-0001

Core splitting involves cutting recovered drill core lengthwise using a diamond saw to produce two representative halves. One half is retained for reference and geological logging, while the other half is sampled for laboratory analysis under controlled and safety compliant procedure (Figure 4).

Figure 4: Splitting of core received from EAS-DD-0001

Figure 5: Samples of EAS-DD-0001 and EAS-DD-002 holes prior to dispatch to lab

A total of 176 individually bagged samples from drill holes EAS-DD-0001 and EAS-DD-002 were securely packaged and staged on pallets prior to laboratory dispatch. The samples were labelled and prepared in accordance with established sample handling and quality control procedures to support analytical integrity (Figure 5).

Saprolite clay core recovered from drill hole EAS-DD-0001 hole is shown arranged in core trays with depth markers to support accurate geological logging. The core displays consistent recovery, providing a continuous record of lithology and structural features for detailed geological interpretation (Figure 6).

Figure 6: Saprolite clay in EAS-DD-0001 diamond hole

The geological section (Figures 7 and 8) shows a saprolitic clay veneer overlying the Medina Granitic Complex of intrusive at Bald Hill and Naked Hill. The near surface saprolite strata is interpreted as autochthonous weathering profile of underlying parent granite. The general trend (strike) of the granitic lithological unit contacts is SW-NE and tentatively dipping 45°-60° towards SW.

The interpretation of inferred contacts is based on limited drillhole data and may be refined through follow up drilling.

Figure 7: Schematic interpreted cross section East Salinas diamond holes EAS-DD-001 and EAS-DD-002

Figure 8: Schematic interpreted cross section East Salinas diamond holes EAS-DD-003 and EAS-DD-004

### Metallurgical test work

Metallurgical test work was undertaken to assess a potential low-cost processing pathway. Leach testing was conducted by SGS Geosol Laboratory Vespasiano using its standard IAC leach test protocol on 13 consecutive downhole saprolite samples from drill hole EAS DD 0001. The sample interval comprised one sample from surface to 2m, followed by consecutive 1m drill run samples.

Samples received by the laboratory weighed greater than 3kg. Oversize material was sieved and reduced to -4mm prior to homogenisation. Each sample was split to generate a head grade aliquot and a leach test aliquot. Leach testing was conducted on 40-gram samples for 30minutes using 160ml of a cold-water solution containing 0.5 mol per litre AMSUL4 solution of pH 4. water solution containing 0.5 mol per litre AMSUL5 solution of pH 4. Following leaching, samples were filtered under vacuum and the residue washed with 80ml of 0.15 mol per litre AMSUL solution.

An aliquot of the leach solution was diluted 25 times with 2% HNO<sub>3</sub> and analysed using ICP-MS and ICP-OES techniques.

<sup>4</sup> Ammonium Sulphate

<sup>5</sup> Ammonium Sulphate

Initial IAC leach testing conducted on 13 consecutive down-hole saprolite samples from EAS-DD-0001 return average recoveries for NdPr of 44.4%, DyTb of 34.0%, SEG of 37.6% and HREE (+Y) of 41.2% using standardised IAC procedures, with recovery improvements expected with further study

Peak IAC leach recoveries for EAS-DD-0001 over 10 – 11m are NdPr of 61%, DyTb of 63%, SEG of 62% and HREE (+Y) of 60%

A summary of the leach testing results for EAS-DD-0001 (0 to 12m) is presented in Table 2.

| STATS   | TREE | La  | Ce | Pr  | Nd  | Sm  | Eu  | Gd  | Tb  | Dy  | Ho  | Er  | Tm  | Yb  | Lu  | Y   | LREE | HREE | NdPr |

Table 2: Summary of IAC leach test statistics in East Salinas

Thorium and uranium leach recovery was negligible. Complete results for this test are provided in Appendix C Table 7.

### Next Steps

Submit remaining drill core samples from remaining 10 drillhole for assay analysis and leach testing.

A follow up programme is needed to determine the footprint and thickness of the saprolite coverage, using local auger drilling, to quickly and cost effectively delineate the East Salina project outcrops and surrounds.

Auger drill samples will be submitted for IAC leach testing to assess the consistency of recovery.

### Tenements/permits

The East Salinas tenements are currently held by Mineração Paranaí Ltda and registered in the state of Minas Geraí. Upon completion of the permit in the official gazette, Mineração Paranaí Ltda will undertake the contractual process to transfer the title to Enova. Details of the East Salinas tenements are outlined in Table 3.

| Area | Licence ID  | Area (Ha)        | Status  | Ownership              | In Transference to |
|------|-------------|------------------|---------|------------------------|--------------------|
| 1    | 832387/2023 | 1,910.49         | Granted | Mineração Paranaí Ltda | ENOVA BRASIL LTDA  |

Table 3: East Salinas Project tenements Minas Gerais, Brazil

## Brazil: A tier-one mining jurisdiction supporting long-Term Growth

Brazil offers a stable, low-risk environment for mining investment, underpinned by a well-established and globally competitive resources sector. As a top exporter of iron ore, gold, bauxite, lithium, rare earths and more, Brazil and particularly the states of Minas Gerais and São Paulo recognise mining as a cornerstone of economic development.

The country boasts investor-friendly policies, with no government ownership mandates, minimal interference, and a progressive regulatory framework encouraging exploration and new project development. Brazil's attractive cost structure, highly skilled workforce, advanced mining services sector, and robust infrastructure including proximity to key cities further enhance its status as a prime destination for resource investment.

### Other projects

Enova has extensive portfolio of tenements and advanced projects. Resources and focus are prioritised to meet project demands. Enova is currently working on several projects, at different stages of development. CODA project work focuses on metallurgical studies for the concentration of titanium, REE, Niobium and Scandium metals. Sighter test work by CIT Senai, Belo Horizonte, continues particle size analysis, semi-quantitative mineralogical study and magnetic separation tests. Test work at Mineral Technology in Brisbane is currently in progress which focuses on magnetic separation and flotation. Our company laboratory in Kuala Lumpur is undertaking leach recovery test work. Enova also remains committed to the development of Charley Creek rare earth project with metallurgical process improvement test work under assessment. Enova is considering follow up exploration in Santo Antonio Do Jacinto, Carai and Resplendor projects.

The Company will also continue to review projects and business opportunities as they arise.

The market will be kept apprised of developments, as required under ASX Listing Rules and in accord with continuous disclosure requirements.

**About Enova Mining**

Enova Mining is a critical minerals exploration and development company with a strategic portfolio of projects across Brazil and Australia, targeting the growing global demand for rare earth elements and battery metals.

The Company's key projects include:

- **The Coda Group of Projects** – prospective for clay-hosted rare earth elements (REE).
- **The Poços de Caldas Project** – a promising ionic adsorption clay REE opportunity.
- **The Charley Creek Project** – prospective for alluvial rare earths, rubidium, and uranium.
- **The Lithium Valley Projects** – including East Salinas, Caraí, Santo Antônio do Jacinto, and Resplendor, all considered prospective for lithium and rare earth elements.

Enova is focused on advancing these high-potential assets through systematic exploration and development to support the global transition to clean energy technologies.

**East Salinas Medina Intrusive Complex: A promising rare earth element (REE) discovery in Minas Gerais**

- **Emerging High-Grade REE Opportunity:** The East Salinas Granitic Complex, situated within the East Brasileiro Orogen in northern Minas Gerais, has revealed highly anomalous surface geochemical results, with Total Rare Earth Oxides (TREO) grades reaching up to 2.17%. The project also boasts exceptionally high magnetic rare earth content, with NdPr (neodymium + praseodymium) oxide ratio reaching up to 38.8%, an average Heavy Rare Earth Oxide (HREO) ratio around 9.95% and average ytterbium oxide content around 387ppm. These results strongly support the presence of REE-bearing saprolite, granite and leucogranite units, confirming the potential for high-grade REE mineralisation across the project area.
- **Expanding Enova's Strategic Footprint:** East Salinas complements Enova's REE exploration portfolio alongside Juquiá, CODA North, and CODA Central. The project's large-scale tenement coverage and its association with post-collisional granites present multiple zones of interest, including the Bald Hill and Naked Hill targets, supporting further subsurface investigations and resource delineation.

- **Multi-Metal Potential and Geological Richness:** In addition to REEs, East Salinas shows elevated levels of neodymium, niobium, and other high-value elements linked with evolved granitic systems. This opens potential for valuable by-products and broader resource development across the tenement package.
- **Leveraging Brazilian Expertise for Efficient Advancement:** Enova's Brazilian geology team has been instrumental in advancing exploration at East Salinas through detailed mapping, systematic sampling, and field validation. Their expertise ensures efficient progression from surface sampling to future drilling and geophysical surveys.
- **Cost-Conscious Exploration with Strong Growth Potential:** Enova is adopting a disciplined, scalable exploration strategy at East Salinas focused on high-impact outcomes. With significant upside and a large tenement footprint, the project stands out as a cost-effective and potentially transformative REE discovery within Brazil's resource-rich landscape.

**The East Salinas project underscores Enova's commitment to building a world-class REE and critical minerals portfolio, combining local geological strength with global technical knowledge to accelerate growth and shareholder value.**

#### **Competent person statement**

The information related to Exploration Targets and Exploration Results is based on data compiled by Subhajit Deb Roy, a Competent Person and Chartered Member of The Australasian Institute of Mining and Metallurgy. Mr Deb Roy is currently working as Exploration Manager with Enova Mining. Subhajit has sufficient experience that is relevant to the style of mineralisation and type of deposits under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Subhajit consents to the inclusion in presenting the matters based on his information in the form.

#### **Forward-looking statements**

This announcement contains forward-looking statements which involve several risks and uncertainties. These forward-looking statements are expressed in good faith and believed to have a reasonable basis. These statements reflect current expectations, intentions or strategies regarding the future and assumptions based on currently available information. Should one or more of the risks or uncertainties materialise, or should underlying assumptions prove incorrect, actual results may vary from the expectations, intentions and strategies described in this announcement. No obligation is assumed to update forward looking statements if these beliefs, opinions and estimates should change or to reflect other future developments.

#### **Precautionary statement**

The exploration results for the East Salinas Project are preliminary in nature and based on surface geochemical sampling, mapping, and early-stage geological interpretation. While initial data indicate the presence of anomalous mineralisation, there has been insufficient exploration to define a Mineral Resource, and it is uncertain if further exploration will result in the delineation of a Mineral Resource. All forward-looking statements, including plans for future exploration and drilling, are subject to various risks, uncertainties, and assumptions. Investors are cautioned not to place undue reliance on these early results, as actual outcomes may differ materially from those anticipated. Resource estimates remain speculative and subject to revision.

#### **Disclaimer**

This ASX announcement (Announcement) has been prepared by Enova Mining Limited ("Enova" or "the Company"). It should not be considered as an offer or invitation to subscribe for or purchase any securities in the Company or as an inducement to make an offer or invitation with respect to those securities. No agreement to subscribe for securities in the Company will be entered into on the basis of this Announcement.

This Announcement contains summary information about Enova, its subsidiaries, and their activities, which is current as at the date of this Announcement. The information in this Announcement is of a general nature and does not purport to be complete nor does it contain all the information which a prospective investor may require in evaluating a possible investment in Enova.

By its very nature exploration for minerals is a high-risk business and is not suitable for certain investors. Enova's securities are speculative. Potential investors should consult their stockbroker or financial advisor. There are many risks, both specific to Enova and of a general nature which may affect the future operating and financial performance of Enova and the value of an investment in Enova including but not limited to economic conditions, stock market fluctuations, commodity price movements, regional

infrastructure constraints, timing of approvals from relevant authorities, regulatory risks, operational risks and reliance on key personnel.

Certain statements contained in this announcement, including information as to the future financial or operating performance of Enova and its projects, are forward-looking statements that: may include, among other things, statements regarding targets, estimates and assumptions in respect of mineral reserves and mineral resources and anticipated grades and recovery rates, production and prices, recovery costs and results, capital expenditures, and are or may be based on assumptions and estimates related to future technical, economic, market, political, social and other conditions; are necessarily based upon a number of estimates and assumptions that, while considered reasonable by Enova, are inherently subject to significant technical, business, economic, competitive, political and social uncertainties and contingencies; and, involve known and unknown risks and uncertainties that could cause actual events or results to differ materially from estimated or anticipated events or results reflected in such forward-looking statements.

Enova disclaims any intent or obligation to update publicly any forward-looking statements, whether because of new information, future events, or results or otherwise. The words 'believe', 'expect', 'anticipate', 'indicate', 'contemplate', 'target', 'plan', 'intends', 'continue', 'budget', 'estimate', 'may', 'will', 'schedule' and similar expressions identify forward-looking statements. All forward-looking statements made in this announcement are qualified by the foregoing cautionary statements. Investors are cautioned that forward-looking statements are not guarantee of future performance and accordingly investors are cautioned not to put undue reliance on forward-looking statements due to the inherent uncertainty therein. No verification: although all reasonable care has been undertaken to ensure that the facts and opinions given in this Announcement are accurate, the information provided in this Announcement has not been independently verified

| <b>Sampling techniques</b> | <ul style="list-style-type: none"> <li><i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i></li> <li><i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></li> <li><i>Aspects of the determination of mineralisation that are Material to the Public Report.</i></li> <li><i>In cases where 'industry standard' work has been done this would be</i></li> </ul> | <p><b>East Salinas Project Diamond Drilling Program:</b></p> <p>East Salinas Project consists of tenements (Table 3) where the areas were sampled at the outcrops and soils surfaces within the tenement by cutting channels, breaking rock chips and digging pit.</p> <p>Diamond holes were drilled on and around the sites of previous high grade rock chip samples. Samples were collected from material of the ½ split fractions from the recovered core. In most locations, a thin saprolite soil layer was observed, overlying granite and granodiorite lithology.</p> <p><b>Diamond drillholes</b></p> <p>The drill cores representing in-situ rocks are preserved in plastic core trays, and depth markers record the depth at the end of each drill run.</p> <p>Diamond core has been sampled on nominal <b>~1 m intervals</b>, within underlying mineralised zone in Granite and Granodiorite formation of Medina Intrusive complex. Shorter sample lengths selected where required by geological variations.</p> <p>Sampling intervals have been carefully designed to <b>align with geological and lithostratigraphic boundaries</b>, ensuring that</p> |

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                              | <p><i>relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</i></p>    | <p>individual lithological contacts are not intersected by sample cuts. <b>Halfcore-core samples</b> were taken and archived submitted for laboratory analysis. At few drill runs, core was split into quarter core for generation of duplicate samples.</p> <p>A comprehensive <b>QA/QC protocol</b> has been applied, including the routine collection and submission of field duplicate, certified reference material, blank samples to monitor analytical quality and reliability.</p> <p><b>Comments on representivity</b></p> <p>The systematic approach to sampling, combined with the thorough documentation, ensures that the data collected is robust and reliable.</p> <p>Samples were collected from core recovered from diamond holes in East Salinas Medina Intrusive Complex.</p> <p>All samples were sent for preparation to the contracted laboratory, SGS Geosol in Vespasiano, MG, Brazil.</p>                                                                                                                                                                                                  |
| <b>Drilling techniques</b>   | <ul style="list-style-type: none"> <li>• Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</li> </ul>                                                                                    | <p><b>Drilling</b></p> <p>Diamond drilling was carried out by Maquesonda MACH 1210 rig, The drilling used a wireline diamond core of HWL size in saprolite veneer lithological unit and HQ diameter in hard underlying granite-granodiorite lithological unit.</p> <p>HWL-size diamond core drilling (~76 mm diameter) was used in soft rock saprolite veneer.</p> <p>HQ-size diamond core drilling (~63.5 mm diameter) was predominantly used in hard rock, employing standard tubes to depths of approximately 50~100 m.</p> <p>All diamond drill holes were collared and drilled <b>vertically downward from surface</b>.</p> <p>Initial drill rig alignment was completed labelling the platform to drill vertically and no reflex tool was used.</p> <p><b>No Downhole surveys</b> were conducted for the test drilling</p> <p><b>No Core orientation</b> was recorded for the test drilling</p> <p>All drill collar locations were picked up using <b>Handheld Garmin GPS</b> to ensure tentative spatial positioning. The collar survey pick up will be undertaken later along with topographic survey.</p> |
| <b>Drill sample recovery</b> | <ul style="list-style-type: none"> <li>• Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>• Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> <li>• Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul> | <p><b>Recovery in Diamond Drillholes</b></p> <p>Calculated after each run, comparing the length of core recovery vs. drill depth by visual inspection. Overall average core recoveries are above 90% in diamond drilling. The drill runs kept at 1m for maximising recovery.</p> <p>Core recovery is verified against the driller's log to confirm that all instances of core loss are properly accounted for, with recovery data systematically recorded in the project database. Intervals impacted by significant core loss may experience grade dilution, as the loss of fine material can impact the representativeness of the recovered core.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Data spacing and distribution</b>                           | <ul style="list-style-type: none"> <li>• <i>Data spacing for reporting of Exploration Results.</i></li> <li>• <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i></li> <li>• <i>Whether sample compositing has been applied.</i></li> </ul>                        | <p>The average spacing between adjacent hole collars are variable, varied according to the location of high-grade surface sample points.</p> <p>The spacing is appropriate to the scale of tenements and variation in geology of zoned complex.</p> <p>In the maiden holes, no compositing done. All samples were prepared for ~1m run except near or around lithological and stratigraphical contacts, where sample length was variable.</p> <p>No Mineral Resource and Ore Reserve Estimation were undertaken.</p>                                                                   |
| <b>Orientation of data in relation to geological structure</b> | <ul style="list-style-type: none"> <li>• <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i></li> <li>• <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i></li> </ul> | <p>The holes drilled vertically in East Salinas are maiden holes in order to investigate at depth extension and confirmation of mineralisation. Once the extent of key mineralised zone is identified, further vertical and inclined holes may be drilled based on the trends of rare element enrichment.</p> <p>The samples bias due to orientation of hole is not known at this stage as maiden holes drilled and mineralisation at depth is not yet known.</p>                                                                                                                      |
| <b>Sample security</b>                                         | <ul style="list-style-type: none"> <li>• <i>The measures taken to ensure sample security.</i></li> </ul>                                                                                                                                                                                                                                                                                                                                           | <p>All samples collected by field technicians were meticulously packed in labelled plastic bags. They were then transported directly to the SGS-GEOSOL, Vespasiano in Minas Gerais, Brazil. The samples were secured during transit to prevent tampering, contamination, or loss. A chain of custody was maintained from the field to the laboratory, with proper documentation accompanying each batch to ensure transparency and traceability throughout the sampling process. Utilising a reputable laboratory further ensures the security and integrity of the assay results.</p> |
| <b>Audits or reviews</b>                                       | <ul style="list-style-type: none"> <li>• <i>The results of any audits or reviews of sampling techniques and data.</i></li> </ul>                                                                                                                                                                                                                                                                                                                   | <p>The site is attended by Enova's Brazilian professional geologist team supervised by Fernando Moya, qualified geologist to carry out, inspect sampling procedures, verify the sampling protocols, secure the transport and storage of samples, verification geological records, review QAQC procedures.</p>                                                                                                                                                                                                                                                                          |

## Section 2 - Reporting of Exploration Results

| Criteria                                       | JORC Code explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                        |           |        |           |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |       |          |  |  |

However, the data such as geological map and geophysical maps in SGB (Geological Survey of Brazil) website covers the area regionally including East Salinas Medina Intrusive complex project tenements. Enova completed several rounds of surface geochemical samples which have been announced in previous ASX releases (Appendix D).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                        |           |        |           |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |       |          |  |  |
| <b>Geology</b>                                 | <ul style="list-style-type: none"><li>• <i>Deposit type, geological setting and style of mineralisation.</i></li></ul>                                                                                                                                                                                                                                                                                                                                                                          | <p>The Medina Intrusive Suite in the East Salinas Project comprises the Granito Maristela, a large I-type granitic batholith covering ~1,150 km<sup>2</sup>. This metaluminous, porphyritic granite exhibits a coarse-grained matrix of quartz, pink K-feldspar, biotite, and allanite, with megacrysts of euhedral feldspar (2–3 cm). It hosts xenoliths of schist and gneiss (e.g., syenitic, tonalitic, and peraluminous varieties) near contacts with the Salinas Formation. The granite forms prominent pão-de-açúcar (sugarloaf) hills, such as Serra do Anastácio (1,430 m), contrasting with the adjacent Detrito-Lateritic Cover (750–900 m), a Tertiary to recent pediment surface with thick saprolite.</p> <p>Structurally, the area is divided into two domains:</p> <ol style="list-style-type: none"><li>1. Older Metasedimentary Domain: Includes the Macaúbas Group (Salinas and Nova Aurora formations), kinzigitic gneisses, and S-type Granito Pajeú, with E-W-trending foliations and fold axes attributed to Brasiliano compression.</li><li>2. Younger Granitic Domain: Dominated by post-tectonic I-type granites (Maristela and Água Branca). The Maristela batholith caused centripetal foliation in surrounding schists ("ballooning" during emplacement) and exhibits NNE to NE</li></ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                        |           |        |           |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |             |          |         |                        |       |          |  |  |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|--------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Data aggregation methods</b></p>                                         | <ul style="list-style-type: none"> <li>• In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</li> <li>• Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> <li>• The assumptions used for any reporting of metal equivalent values should be clearly stated.</li> </ul> | <p>The database of collar, geology, assays has been compiled as per industry standard practices and for the use of resource modelling in the next stage. No topographic and drill hole collar survey is undertaken in CODA East.</p> <p>The data are being compiled in Collar, Survey, Assay and Geology files. The Assay data has been compiled in the Assay table and TREO and TiO<sub>2</sub>% are given in Appendix C, Table 4. The database has been compiled as per industry standard practices and for the use of resource modelling in the next stage.</p> <p>The conversion of Total Rare Earth Oxide (TREO) has been calculated using standard conversion table as mentioned below. The conversion of elemental assay results to expected common rare earth oxide products, uses conversion factors applied relating to the atomic composition of common rare earth oxide sale products. The following calculation for TREO provides REE to RE oxide conversion factors and lists the REE included:</p> $\text{TREO} = (\text{Ce} \times 1.23) + (\text{Dy} \times 1.15) + (\text{Er} \times 1.14) + (\text{Gd} \times 1.15) + (\text{Ho} \times 1.15) + (\text{La} \times 1.17) + (\text{Lu} \times 1.14) + (\text{Nd} \times 1.17) + (\text{Pr} \times 1.21) + (\text{Sm} \times 1.16) + (\text{Tb} \times 1.18) + (\text{Tm} \times 1.14) + (\text{Y} \times 1.27) + (\text{Yb} \times 1.14)$ <p><b>Cut-off calculations</b></p> <p>For the reporting of significant intersections and assays, the downhole aggregation for the cut-off calculation is based on the average of 3 consecutive samples that are greater than the nominal cutoff. No more than 4 samples below cut-off are accepted in any 4m consecutive aggregation but the aggregation with the below cut-off sample must remain above the nominal cut-off. As an exception, assays within saprolite clay have been aggregated to represent the significant grade.</p> <p><b>Nominal Cut-offs</b></p> <p><b>TREO</b></p> <p>Nominal cut-offs of 1000 ppm, 2000 ppm and 3000 ppm have been applied for calculation of significant results of <b>TREO</b>. Notable high-grade assays have been calculated with nominal cut-off 3000 ppm <b>TREO</b>.</p> |
| <p><b>Relationship between mineralisation widths and intercept lengths</b></p> | <ul style="list-style-type: none"> <li>• These relationships are particularly important in the reporting of Exploration Results.</li> <li>• If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</li> <li>• If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</li> </ul>                                                                                                                                                                             | <p>As the geometry of the mineralisation is not known and the maiden test holes were drilled with the vertical orientation to explore the extent of mineralisation. The downhole lengths are likely to bring out the width of the mineralised zones.</p> <p>Although, there was no downhole survey done, the drill rig was aligned vertically to ensure penetrating vertically through granite -granodiorite strata. Hence any potential bias of drilling orientation will be reviewed during resource estimation in this context.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Diagrams</b>                           | <ul style="list-style-type: none"> <li>• <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i></li> </ul>                                                                                                                     | <p>The data provided in this report aids readers in comprehending the information more effectively. The document includes various diagrams and supplementary details, which enhance the clarity and accessibility of the geological findings and exploration results. Please refer to the Figure 1 to 8 for drillhole collars, assays, drill plan, rock types and drill targets related data and information. Figure 2 shows completed drillhole collar points and inset shows the East Salinas tenement along with neighbouring tenements.</p>                                                                                                                                                                                                                                                                               |
| <b>Balanced reporting</b>                 | <ul style="list-style-type: none"> <li>• <i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i></li> </ul>                                                                                                                                                             | <p>The data presented in this report aims to offer a transparent and comprehensive overview of the exploration activities and findings. All data have been listed in table 1-6. It thoroughly covers information on sampling techniques, geological context, prior exploration work, and assay results. Relevant cross-references to previous announcements are included to ensure continuity and clarity. Diagrams, such as drillhole collar point plan and tenements maps and tables, are provided to facilitate a deeper understanding of the data.</p> <p>Additionally, the report distinctly mentions the source of the samples, whether from granite -granodiorite litho-units to ensure a balanced perspective. This report represents the exploration activities and findings without any known bias or omission.</p> |
| <b>Other substantive exploration data</b> | <ul style="list-style-type: none"> <li>• <i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i></li> </ul> | <p>The report includes diamond drillhole assay results and regional geology descriptions.</p> <p>There is no additional substantive, relevant and significant exploration data to report currently.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Further work</b>                       | <ul style="list-style-type: none"> <li>• <i>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i></li> <li>• <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i></li> </ul>                            | <p>In the next phase will focus on further step out drilling along the interpreted trends defined by the current drill holes to assess strike and dip continuity and expand the known extent of mineralisation. These step out holes will be designed to systematically test along strike and dip from existing intersections, refining the geological model and supporting the transition from target testing to broader mineralisation delineation at East Salinas.</p> <p>Diagrams and figures in the current document are highlighting the outcomes of drillhole sampling and identify high anomalous zones.</p>                                                                                                                                                                                                          |

### Leach Results (analysis detail)

[illegible][illegible]

Table 7: Leach test results of TREO from drillhole samples of EAS-DD-0001 in East Salinas Medina Intrusive Complex

<sup>6</sup> Calculated leach recovery: %recovery = leaching of <4mm / primary head grade of whole sample
