

2026 Field Programs Underway Across Multiple Targets in Bobija Project Area

HIGHLIGHTS:

- Phase 2 drilling program commenced in the Bobija Mine area, targeting extensions to high-grade gold-silver-base metal-barite mineralisation immediately beneath the floor of the historic Bobija open pit mine.
- Step-out soil sampling commenced across the highly prospective Tisovik area, targeting extensions to recently defined large-scale silver-lead-zinc-antimony soil anomalies defined over a 5km strike length at the Tisovik, Crvene Stene and Kozila Prospects.
- In-country exploration team and infrastructure expanded, to support significant ramp-up of exploration activity during 2026.

Middle Island Resources Limited (ASX:MDI, “Middle Island” or “the Company”) has commenced its 2026 exploration program, initiating exploration activities across two highly prospective target areas in the Bobija Project area, Serbia.

MDI Chief Executive Officer, Peter Spiers commented:

“The Company has eagerly awaited the start of the 2026 exploration field season in Serbia and is pleased to report on the commencement of exploration across multiple target areas.”

We have commenced Phase 2 drilling at the Bobija Mine site, comprising 17 drill holes for up to 1,500 metres. This will follow up on the exciting drilling results achieved in late 2025, which included 52m @ 1.17g/t Au, 26.0g/t Ag and 1.01% Zn ⁽¹⁾. The Bobija deposit is an under-explored, high-grade polymetallic deposit, within a granted mining lease, surrounded by substantial, poorly-tested exploration tenure. This is the first of multiple phases of drilling proposed for Bobija during 2026.

At the same time, we have also commenced step-out soil sampling programs in the Tisovik area, building on the recent discovery of a 5km long, open-ended zone, that is highly anomalous for silver, lead, zinc and antimony. Peak assay results from the initial soil sampling programs included 7.1g/t Ag, 4,685ppm Pb, 969ppm Zn and 1,049ppm Sb. ⁽²⁾

The Company is also expanding its in-country exploration team and exploration infrastructure to support a significant ramp-up of exploration activity across 2026, and we look forward to reporting on our exploration activities as results come to hand throughout the year.”

¹ Refer to MDI ASX announcement “Bobija Drill Assays Confirm Widespread Gold-Silver-Lead-Zinc” dated 17 Dec. 2025.

² Refer to MDI ASX announcement “Large-Scale Silver-Lead-Zinc-Antimony Targets at Tisovik” dated 12 Feb. 2026.

Bobija Project – Phase 2 Drilling

Middle Island has commenced its Phase 2 drilling program at the Bobija Polymetallic Project located in Western Serbia. A track-mounted reverse circulation (RC) drill rig has been mobilised to the site and drilling has commenced. The Phase 2 drill program will include 17 drill holes for up to 1,500 metres of drilling. The location of the Phase 1 and proposed Phase 2 drill hole collars are shown in Figure 1.

Figure 1: Plan view of Bobija Mine area showing location of Phase 1 and proposed Phase 2 drill hole collars.

The Phase 2 drilling program follows on from a highly successful maiden (Phase 1) drilling program reported in December 2025 ⁽¹⁾, that recorded widespread mineralisation across the historic mine area including:

- **BMLRC001 - 52m @ 1.17g/t Au, 26.0g/t Ag, 0.12% Cu, 0.39% Pb & 1.01% Zn (from 9m)**
- **BMLRC002 - 17m @ 1.44g/t Au, 34.6g/t Ag, 0.18% Cu, 0.49% Pb & 1.97% Zn (from 40m)**
- **BMLRC002 - 11m @ 1.14g/t Au, 52.1g/t Ag, 0.24% Cu, 1.19% Pb & 1.56% Zn (from 71m)**
- **BMLRC003 - 11m @ 3.15g/t Au, 22.6g/t Ag, 0.10% Cu, 0.57% Pb & 1.09% Zn (from 28m)**
- **BMLRC005 - 23m @ 1.12g/t Au, 50.6g/t Ag, 0.20% Cu, 1.17% Pb & 1.94% Zn (from 9m)**
- **BMLRC008 - 23m @ 1.15g/t Au, 20.6g/t Ag, 0.14% Cu, 0.67% Pb & 0.40% Zn (from 4m)**
- **BMLRC009 - 16m @ 0.94g/t Au, 12g/t Ag, 0.28% Pb & 0.43% Zn (from 1m)**

The Phase 1 drilling results included significant intervals of mineralisation in the previously interpreted barren area between the West Zone and North Zone of mineralisation, in particular drill hole BMLRC001 that intersected **52m @ 1.17g/t Au, 26.0g/t Ag and 1.01% Zn** (from 9m depth) (Figure 1 and Figure 2).⁽³⁾

³ Over-range barium assay results are still awaited from the laboratory.

The Phase 1 drilling results suggest continuity of mineralisation between the West and North Zones, and further support the Company's proposition that gold-silver+/-base metal and barite mineralisation at Bobija is developed in a thick, broadly continuous, sub-horizontal layer across the mine area.

Several drilling programs are proposed during 2026, focussed on assessing the distribution and grade of polymetallic / barite mineralisation across the greater Bobija mine area.

Figure 2: Bobija mine area - Schematic cross section AA' (viewed to NNW) – showing location of Phase 1 drill holes and significant intercepts. ⁽¹⁾

Tisovik Soil Sampling

The Tisovik target is located 4km north-east of the Bobija Mine and represents a large, emerging polymetallic system defined by extensive silver-lead-zinc-antimony soil anomalism. Soil sample results, reported in November 2025, included peak assay results of 7.1g/t Ag, 4,685ppm Pb, 969ppm Zn and 1,049ppm Sb. ⁽²⁾

Anomalism has been recognised across multiple target areas over an approximate 5km east-west strike length, including the Tisovik, Crvene Stene (Red Rock) and Kozila targets, reinforcing the continuity and multi-element nature of the mineral system (refer Figure 3 showing lead assay results).

The Company has commenced additional soil sampling in the Tisovik area, initially focussed on extending the current sample lines to the north and east to the limit of the licence areas on both the Bobija and Bobija East licences (Figure 4).

Future programs will focus on infill sampling within the main zones of anomalism to define targets for more detailed investigation including rock chip sampling, trenching and drilling. This work will be ongoing during the current field season.

Figure 3: Soil sample results in the Tisovik area showing multiple zones of interpreted +400ppm lead-in-soil anomalism.⁽²⁾

Figure 4: Central Bobija Project area showing location of current "step-out" soil sample program.

Expanded Exploration Capability

The Company is planning for a significant ramp-up in exploration activity during 2026. To support such activity, the Company is in the process of expanding its in-country exploration team and exploration infrastructure.

The expansion will include, recruitment of additional personnel (geologists and field-technicians), and the establishment of additional infrastructure. This will include portable XRF equipment (for rapid analysis of field samples), additional back-office database support (to allow field staff to focus on on-ground activities), and additional sample processing and transport facilities (including diamond drill core processing facilities for future diamond drilling programs).

These enhancements will allow the Company to progress multiple exploration programs simultaneously, advance priority exploration targets more rapidly, and ultimately increase overall exploration activity and newsflow.

The Company looks forward to reporting on its future exploration programs as results come to hand.

Results Pending

The Company is awaiting assay results from a number of exploration programs, which include:

Bobija Project	Bobija ML/EL	Phase 2 RC drilling results
	Bobija ML/ EL	Phase 1 RC drilling results (barium)
	Kamenita Kosa EL	Soil sampling (copper targets)
	Bobija / Bobija East EL	Soil sampling (silver-lead-zinc-antimony targets)
Timok Project	Brodica EL	Soil sampling (gold targets)

This announcement has been authorised for release by the Middle Island Resources Board.

Forward Looking Statements

Statements contained in this release, particularly those regarding possible or assumed future performance, costs, dividends, production levels or rates, prices, resources, reserves or potential growth of Middle Island, industry growth or other trend projections are, or may be, forward looking statements. Such statements relate to future events and expectations and, as such, involve known and unknown risks and uncertainties. Actual results and developments may differ materially from those expressed or implied by these forward-looking statements depending on a variety of factors.

Competent Persons Statement

The information in this announcement that relates to Exploration Results is based on, and fairly represents, information compiled by Mr Peter Spiers, a Competent Person who is a Member of the Australian Institute of Geoscientists and a full-time employee of the Company. Mr Spiers has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Spiers consents to the inclusion in the announcement of the matters based on his information in the form and context in which it appears. The Exploration Targets described in the announcement are conceptual in nature and there is insufficient information to establish whether further exploration will result in the determination of Mineral Resources.

Exploration Results

This announcement contains information in relation to exploration results extracted from the Company's previous ASX announcements, which are available to view on the Company's website.

The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements. The Company confirms that the form and context in which any Competent Person's findings are presented have not been materially modified from the original market announcements.

About Middle Island Resources (ASX:MDI)

Middle Island Resources recently acquired a portfolio of exploration projects located in the Western Tethyan Mineral Province, Serbia, that are highly prospective for the discovery of gold and base metal deposits.

The Western Tethyan Mineral Province is a world class geological setting containing giant copper, gold and silver deposits, including, Zijin Mining's Cukaru Peki project (22.6Mt Cu and 17.1 Moz Au) and recent Malka Golaja discovery (~150Mt @ 1.9% Cu and 0.6g/t Au), DPM Metals' Vares project (20.9Mt @ 1.1g/t Au, 153g/t Ag, 0.4% Cu, 2.8% Pb & 4.3% Zn), DPM Metals' Coka Rakita project (7.3Mt @ 6.44g/t for 1.5Moz Au) and Rio Tinto's Jadar project (139Mt @ 14.7% B₂O₃ & 1.8% Li₂O). BHP is also active in the country under an earn-in agreement with Mundoro Capital Inc.⁽⁴⁾

The Company's Serbian exploration portfolio comprises 14 licences either 100%-owned or held under agreements with a path to 100% ownership, covers approximately 620km², and encompasses the Bobija, Timok and Priboj project areas (refer figure below).

The Company completed its maiden drilling program on the flagship Bobija Project in late 2025 and generated very positive results that confirm the significant potential of the project area including 52m @ 1.17g/t Au, 26.0g/t Ag, 0.12% Cu, 0.39% Pb & 1.01% Zn (from 9m in BMLRC001).⁽¹⁾

Middle Island has planned a significant ramp-up of exploration activity in 2026, with drilling proposed across multiple target areas.

About the Bobija Project

The Bobija Project is located in central-western Serbia about 100 km southwest of Belgrade. The project comprises six mineral licences with a total area of 208km². Three exploration licences are already granted (Bobija, Bobija East and Kamenita Kosa), and an application has been submitted for a fourth licence (Orovica). The Company also holds a 10-year option to acquire two granted mining licences (Bobija and Tisovik ML's) from a local company, Bobija doo Ljubovija (Figure 6).

MDI's initial focus in the project area is the Bobija mine area (Bobija ML), where barite-sulphide mineralisation is exposed in the floor of the historic open pit mine. Historic exploration in the Bobija Mine area has included exploratory underground development by the former Government of Yugoslavia, as well as several phases of exploration drilling completed between the 1960's and 1980's which targeted barium, lead, zinc +/- silver.

In 2014 – 2017 Reservoir Minerals and Nevsun Resources completed minor drilling in the Bobija Mine area and were the first groups to assay for gold. Drilling recorded significant flat-lying near-surface polymetallic (barite-sulphide) mineralisation hosted in Triassic sediments and demonstrated the potential for significant gold and silver associated with the base metal mineralisation.

The Bobija deposit and surrounding region remains inadequately explored and offers potential for the delineation of significant polymetallic (gold-silver-copper-lead-zinc) and barite mineralisation through the application of a comprehensive and systematic exploration program. Furthermore, the full extent of the gold mineralisation within the Bobija deposit is yet to be fully quantified with gold potentially representing a significant component of this polymetallic deposit.

Appendix 1 – JORC Code, 2012 Edition Table 1 – BOBIJA PROJECT

Section 1 Sampling Techniques and Data (Criteria in this section apply to all succeeding sections)

Criteria	JORC Code explanation	Commentary
<p>Sampling techniques</p>	<ul style="list-style-type: none"> Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. 	<p>This table relates to all reported exploration work completed to date within the Bobija Project area including historical third-party exploration and exploration completed by Middle Island Resources Ltd (the “Company”). Exploration results attributed to the Company include exploration completed by Konstantin Resources Ltd that was acquired by the Company in November 2025.</p> <p><i>Historical:</i></p> <ul style="list-style-type: none"> Historical exploration work reported from the Bobija Project has included mapping, soil sampling, rock chip sampling, geophysical surveys (gravity), underground development, underground face sampling and diamond drilling. Historical exploration has been completed by former Government-owned entities including RMHK Trepca and Geozavod (Government), Mineco Limited (Mineco), and by Balkan Exploration and Mining doo, a Serbian-registered company that was held under the successive ownership of Reservoir Minerals (Reservoir), Nevsun Resources (Nevsun) and Zijin Mining Group (Zijin). The sampling methodology applied to historic samples is generally unknown other than as described in subsequent sections of this table. <i>Soil sampling:</i> Historic soil sampling was reported by Nevsun in 2017, however no results are available. <i>Rock chip (channel) sampling:</i> a single historical rock chip sample is reported from the Bobija Project area: Reservoir: 1x 6m channel sample (2012) <i>Geophysics:</i> historical geophysical surveys recorded from the Bobija Project area include: Gravity: 0.45km² area (Reservoir, 2014) <i>Underground development:</i> More than 9km of historical underground development is recorded from the Bobija Project area from the Bobija, Tisovik and Rebelj mines. <i>Underground channel sampling:</i> 546 historical underground channel/face samples are recorded from historic mines and workings in the Bobija Project area including the Bobija, Tisovik and Rebelj mines. <i>Drilling:</i> 77 historical diamond drill holes are recorded from the Bobija Project area including: Government: 54 holes for 4,036.50m (1964-88) Reservoir: 8 holes for 622.90m (2014) Nevsun: 15 holes for 1,632.00m (2016/17) <p><i>Middle Island:</i></p> <ul style="list-style-type: none"> <i>Stream sediment sampling:</i> 198 samples were collected in 2024 on a typical 1km² drainage area basis. A nominal 3kg sample was collected from active drainage system and sieved on site to -1mm prior to submission to the laboratory. The entire laboratory sample is sieved to -80# mesh to produce a 250g subsample and 30g charge for fire assay and ICP-MS finish (FAM303) and multi-element analysis by 4-acid digestion with ICP-MS finish (IMS40B). <i>Soil sampling:</i> 421 samples (including 18 field duplicates) were collected in late 2025 from the Bobija, Bobija East and Kamenita Kosa exploration licences. The exploration results reported in this announcement relate to 232 soil samples (including 11 field duplicates) from the Bobija East exploration licence. Typically, the top 10 cm of cover material was removed and a 2-3kg sample collected from the B/C horizon for submission to the laboratory. The entire sample is pulverized to produce a 250g sub-sample and a 50g charge for fire assay and ICP-MS finish (FAM505) and multi-element analysis by 4-acid digestion with ICP-MS finish (IMS40B).

Criteria	JORC Code explanation	Commentary
		<ul style="list-style-type: none"> • <i>Rock chip sampling</i>: 68 samples were collected between 2023-25 from outcrop, sub-crop, float material and stockpiles. Sample weight was typically 2-3kg and samples were submitted to the laboratory in whole. Laboratory samples were crushed and pulverised to produce 250g pulps and a 50g charge for fire assay with atomic absorption finish (FAA505) and multi-element analysis by four-acid digestion with ICP-MS finish (IMS40B). • <i>Rock chip (channel) samples</i>: 163 samples were collected in 2025 (including 6 field duplicates) from outcrop in the Bobija Open Pit. Samples were cut using a diamond saw blade with an approximate 10cm x 10cm continuous sample taken from the rock face. Samples were submitted to the laboratory in whole. Laboratory samples were crushed and pulverised to produce 250g pulps and a 50g charge for fire assay with atomic absorption finish (FAA505) and multi-element analysis by four-acid digestion with ICP-MS finish (IMS40B). Over range Cu, Pb and Zn (>10,000ppm) and Ag (>10ppm) are re-analysed using a standard ore grade method utilising a four-acid digest with ICP-AES finish (AAS42S). • <i>Drilling</i>: an 816m reverse circulation (RC) drilling program was completed in the Bobija Mine area in late 2025. RC drill samples (drill chips) were collected from the drill rig at 1m intervals and riffle split to provide a 4-6kg sub-sample for submission to the laboratory. Laboratory samples were crushed and pulverised to produce 250g pulps and a 50g charge for fire assay with atomic absorption finish (FAA505) and multi-element analysis by four-acid digestion with ICP-MS finish (IMS40B). Over range Cu, Pb and Zn (>10,000ppm) and Ag (>10ppm) are re-analysed using a standard ore grade method utilising a four-acid digest with ICP-AES finish (AAS42S). Assay results are not yet available.
Drilling techniques	<ul style="list-style-type: none"> • Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.). 	<p>No new drilling results are reported in this announcement.</p> <p><i>Historical:</i></p> <ul style="list-style-type: none"> • Diamond drilling completed in the Bobija Project area between 1964 and 2017 comprised 69 surface diamond drill holes and 8 underground diamond drill holes for more than 6,200m of drilling. Details of the drilling techniques are unknown other than as described below. <ul style="list-style-type: none"> - <i>Government</i>: completed 46 surface and 8 underground diamond drill holes between 1964 and 1988 focussed on the Bobija and Rebelj deposits for more than 4,000m of drilling. Core size ranged from 116mm (at the collar) reducing to 101mm, 86mm, 76mm, 66mm and 56mm diameters. - <i>Reservoir</i>: completed 8 surface diamond drill holes in 2014 focussed on the Bobija deposit for 622.90m. - <i>Nevsun</i>: completed 15 surface diamond drill holes between 2016 and 2017, focussed on the Bobija deposit, for 1,632.00m. <p><i>Middle Island:</i></p> <ul style="list-style-type: none"> • Reverse circulation drilling was carried out by a Serbian contractor using a Gemsa multipurpose (MP85H) drill rig with a downhole hammer and 129mm face sampling drill bit. • All collars are lined with a 6m casing of PVC pipe.
Drill sample recovery	<ul style="list-style-type: none"> • Method of recording and assessing core and chip sample recoveries and results assessed. 	<p>No new drilling results are reported in this announcement.</p> <p><i>Historical:</i></p> <ul style="list-style-type: none"> • No methods are recorded for historical drilling other than as described below. <ul style="list-style-type: none"> - <i>Government</i>: drill core recoveries were recorded for each drill hole. Recoveries were poor and averaged 78% for available drill holes. - <i>Reservoir Minerals</i>: Core recovery through the reported mineralised intervals was generally 100%. <p><i>Middle Island:</i></p>

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	<ul style="list-style-type: none"> Drill holes were oriented to intersect target geologic structures at the most oblique (perpendicular) angle possible, having regard for the interpreted orientation of the structure, the depth of the drill target/s, and the set-up and depth capabilities of the drill rig. To the extent known, the drilling is assumed to be unbiased. <p><i>Historical:</i></p> <ul style="list-style-type: none"> <i>Tisovik Mine:</i> None of the 4 historical surface diamond drill holes reported from Tisovik Mine area intersected mineralisation. <i>Bobija Mine:</i> The Bobija deposit is interpreted as a generally flat-lying stratigraphically controlled VMS deposit. Of the 44 historical surface diamond drill holes reported within the immediate mine area (for which co-ordinate data is available) 84% are drilled with a dip equal to or greater than 60°, and 80% are drilled with a dip equal to or greater than 75°. The orientation of historical drilling is therefore considered unbiased. <p><i>Middle Island:</i></p> <ul style="list-style-type: none"> No orientation-induced sampling bias is considered to have been introduced to drilling completed to date in the project area.
Sample security	<ul style="list-style-type: none"> The measures taken to ensure sample security. 	<p><i>Historical:</i></p> <ul style="list-style-type: none"> The chain of custody for historical exploration samples is not recorded or known. <p><i>Middle Island:</i></p> <ul style="list-style-type: none"> The Company maintains a secure direct chain of custody from site to the laboratory for all samples. All samples are double bagged and transported or escorted to the laboratory by Company personnel.
Audits or reviews	<ul style="list-style-type: none"> The results of any audits or reviews of sampling techniques and data. 	<p><i>Historical:</i></p> <ul style="list-style-type: none"> The use of historical audits and reviews is not recorded or known. <p><i>Middle Island:</i></p> <ul style="list-style-type: none"> Internal review of sampling techniques and standard operating procedures are periodically undertaken by the Company resulting, where relevant, in enhanced operating procedures. The Company routinely completes internal peer review of all exploration results.

Section 2 - Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. 	<ul style="list-style-type: none"> The Bobija Project comprises three granted exploration licences (Bobija, Bobija East and Kamenita Kosa) and one exploration licence application (Orovica) all held 100% by the Company. In addition, the Bobija Project includes two granted mining licences (Bobija ML and Tisovik ML) accessed under a 10-year agreement with a Serbian-registered company Bobija doo Ljubovija. Subject to mine development by the Company, the vendor is entitled to an 0.5% NSR royalty capped at a cumulative total of €0.5m. The Bobija Project licences include 52 sites of cultural significance that restrict or prohibit exploration activities in the immediate vicinity of such sites. The Bobija Project licences do not include any areas where environmental protection zones have been formally designated or where designation has been initiated. However, the Nature Protection Institute of Serbia, under the Ministry of Environmental Protection, has applied environmental protection conditions to three areas within the Project area (totalling 48km²) that either prohibit certain exploration activities without additional

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	<p>specific approval (including invasive activities such as trenching and drilling) or apply seasonal restrictions to activities during the period 15 May to 31 July.</p> <ul style="list-style-type: none"> Approximately 44% of the Project area (92.3km²) is included within the boundaries of the Ecological Network of Serbia (Valjevo Mountains area) which includes: <ul style="list-style-type: none"> an Important Bird Area (RS025IBA) (92.3km²), and a Prime Butterfly Area (Povlen 15) (7.8km²). In the future, the Government may impose additional licence conditions, or designate new areas of cultural or environmental significance, that may impact on the Company's exploration and development activities. <ul style="list-style-type: none"> The Company's 100%-held exploration licences and exploration licence application are in good standing. The Company holds all necessary licences to undertake exploration activities. The third-party mining licences, accessed via a 10-year agreement, are valid but are not in good standing due to the failure of the licence holder to meet various licence holder obligations associated with historic mining activities. The Company, in collaboration with the licence owner (Bobija doo Ljubovija) and in consultation with the Ministry of Mines, has commenced a series of actions that seek to re-establish the standing of the licences over an approximate 2-year timeframe. Landowner permission is required to undertake invasive exploration activities (including trenching and drilling). The Company anticipates that it will require additional access agreements dependent on the location and type of future exploration activities. A landowner may, by verbal or written notification, deny the right of access for exploration activities. However, companies retain the right to expropriate land for exploration or mining purposes subject to statutory approval.
Exploration done by other parties	<ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. 	<ul style="list-style-type: none"> Western Serbia has a long history of mining. Numerous copper deposits hosted within the regional diabase-chert formations were exploited by Roman and Sasa miners. There has also been mining in and around the Veliki Majdan site since the 14th Century. Exploration of largest known deposit in the district, Veliki Majdan, started in the 1930's. Development of other deposits in the region followed including Tisovik (1935) and Bobija (1948). Exploration in the second half of the 20th century was mainly advanced by the Government and related entities including Geozavod and RMHK Trepca with the most intensive activity occurring during 1964-65, 1974-75 and 1986-88. Modern-era exploration within the Bobija Project area has been undertaken by two companies including Mineco (~2015) and Balkan Exploration and Mining doo (BEM). BEM was held under the successive ownership of three different companies including Reservoir (2007-14), Nevsun (2016-17) and Zijin (from 2018). Historical exploration drilling has substantially focussed on known deposits.
Geology	<ul style="list-style-type: none"> Deposit type, geological setting and style of mineralisation. 	<ul style="list-style-type: none"> The Bobija Project licences and occur within the Ljubovija and Valjevo 1: 100,000 map sheets. The Bobija Project area is centred on the western edge of the Vardar geo-tectonic zone. The project licences are comprised of three geo-tectonic units: <ul style="list-style-type: none"> <i>Drina-Ivanjica Terrain</i>: forms the southern part of the project licences and consists of Palaeozoic schists and sandstones, Lower Triassic conglomerates, sandstones and marls (host of Pb-Zn-Au-Ag-barite mineralisation), Middle Triassic limestones and
