ASX : ALR

South Oko Geochemistry Defines Two Major Targets

Extensional soil program defines second compelling blind target beneath duricrust

- **Ongoing soil sampling has defined a second major geochemical drill target at SOKO positioned along the Oko Shear;**
- **Assay results from recent sampling have confirmed extensions to the previously defined W3 anomaly, now establishing a second major ~2.1km strike extensive geochemical target for drill testing.**
- **The completion of the initial SOKO grid highlights two immediate drill targets:**
  - **W1 Target (~1.9km strike extent) – The largest coherent >100ppb Au soil anomaly identified to date on the Oko Shear Contact. This remains open to northwest and east.**
  - **W3 Target (~2.1km strike extent) – Located south of W1 Target, an extensive 50 to >100ppb Au soil anomaly – significantly this is a coherent target identified on generally barren duricrust.**
- **Both robust geochemical anomalies at W1 and W3 Targets spatially coincide with chargeability and resistivity highs, suggesting potential for a structurally controlled gold system.**
- **Notably, the W3 anomaly is considered highly significant given the recent sampling from the duricrust material returned a robust anomalous signature. Duricrust – a barren surficial layer commonly developed in environments such as South Oko, is generally unresponsive to soil geochemistry. This is the first occurrence at SOKO, where a duricrust has generated a clear response, indicating a highly prospective target given the covered setting.**
- **Additional exploration activities continue to be executed swiftly:**
  - **Trenching:** A total of 1.9km of trenching has been completed, with results pending. These comprise of 4 shallow trenches (~3m depth) and 3 deep trenches (~6m depth). Trenching remains ongoing with ~5km planned.
  - **Soils:** 145 samples dispatched pending results, 81 additional soil samples completed this week. Soil sampling will soon focus on southern extension of the Oko Shear with the goal of generating new drill targets.
  - **Auger:** Four lines on the felsic unit, east of the Oko Shear Contact complete, with 40 holes pending results. Another three lines currently being executed on the W1 target.
  - **Ground Geophysics:** Nearing completion with ground magnetics at 91% completion and Pole-Dipole at 67% completion. LiDAR and Aeromagnetics are planned to commence subsequently.
  - **Camp Establishment:** North Peters Camp upgrades to office/admin facility being undertaken alongside construction of a new core shed facility.
  - **Drilling:** Drill pads currently being cleared at North Peters, with RAB & diamond drilling at both SOKO and North Peters scheduled to commence in April.

Altair Minerals Limited CEO, Faheem Ahmed, commented:

"I am pleased to report further soil sampling results at South Oko, which have now defined two broad and well defined geochemical anomalies – namely the W1 and W3 targets.

The W1 target spans approximately 1.9km in strike extent and represents the largest coherent >100ppb Au soil anomaly identified to date along the Oko Shear Contact. In contrast, the newly defined W3 target extends over approximately 2.1km of strike and is interpreted as a blind target beneath duricrust, demonstrating a notably strong geochemical response given its covered setting.

Both these geochemical targets align are spatially associated with the recently identified chargeability and resistivity anomalies from the Inverse Polarization gradient array survey Ground magnetics and pole-dipole IP surveys are nearing completion and are expected to further refine drill targeting.

Altair's in-country team has made exceptional progress within a short amount of time - not only advancing geochemical and geophysical programs, but also managing logistics, constructing infrastructure across two camps, expanding the team and procurement of drill rigs and heavy machinery.

During my recent site visit with Altair Non-Executive Director Rob Curtis, we observed first-hand the scale of activities being executed and operational efficiency led by our Guyanese exploration team across both the SOKO and NP prospects. The SOKO camp is now capable of accommodating up to 40 exploration and support personnel, positioning the Company well for its upcoming major drill programs.

I thank our shareholders for their continual support, and welcome new investors as we accelerate exploration activities and position the Company for its next phase of growth through drilling in April."

South Oko Soil Sampling Results

As part of the 2026 South Oko soil sampling program, priority was placed on infill and extensional testing over the prominent W1 Target and the newly established W3 Target.

This batch of soil sampling results focused on infill and extensional sampling across the W3 Target. The objective of this sampling program was to follow-up on a previously identified prospective anomaly identified on the peripheral of the W3 Target, which has now successfully defined a second major geochemical target at SOKO. A total of 305 samples are reported in this batch.

Soil sampling was undertaken within the B-horizon, approximately 30-50cm below surface, consistent with previous sampling methodology and aligned with the sample media used to define the neighbouring Oko West soil anomaly. This consistency in methodology provides confidence in the accuracy of anomaly delineation and supports reliable comparative interpretation between anomalous zones.

Samples were collected on a 50m spacing along east-west oriented lines, with line spacing of 200m. Alluvial material and alluvial beds were deliberately avoided to maintain sample media integrity and to confirm that anomalous responses are representative of in-situ targets rather than transported material.

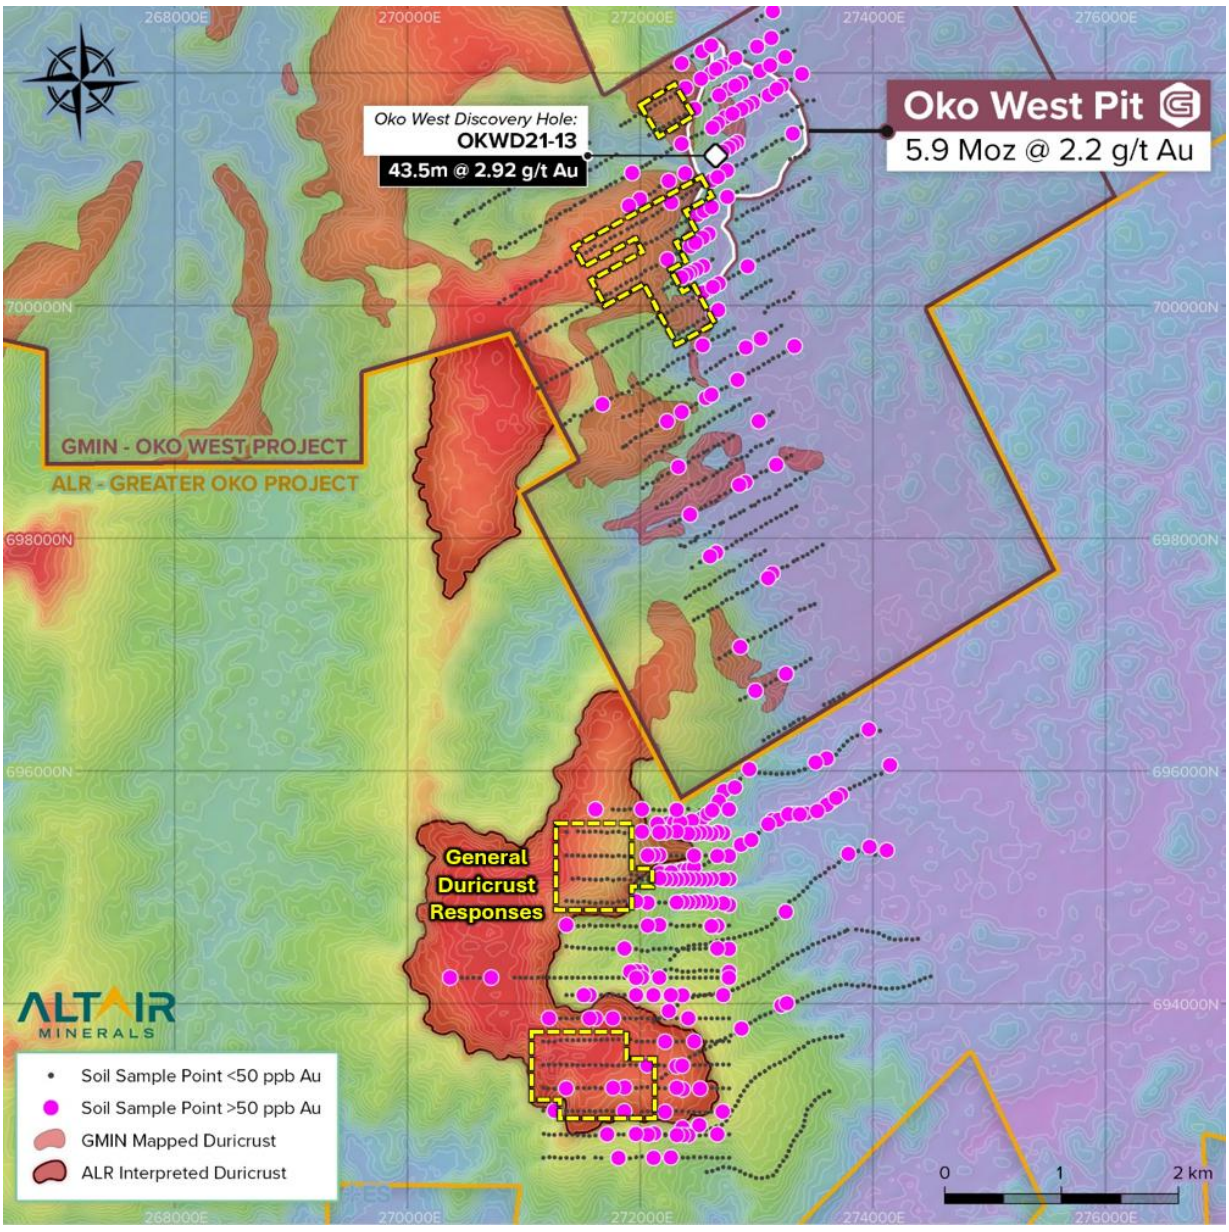

Figure 2: *2026 Soil sampling program progress ongoing at SOKO. Overlaid with the duricrust mapped within Oko West property and projected duricrust partially mapped at SOKO. Coordinates in WGS84, UTM Zone 21N.*[1,5,22]

W3 Soil Sampling

As illustrated in Figure 2, the majority of the sampling on the W3 target were collected over the duricrust - a leached laterite cap that generally masks or inhibits any soil geochemical response with transported gravels eroded on the surface on top of the hard leached cap.

The masking phenomenon is clearly demonstrated in Figure 2. For example, the W1 target soils anomaly becomes effectively unresponsive as soon as it enters the duricrust to the west. Furthermore, on Oko West in Figure 2, this phenomenon can also be seen whereby the geochemical anomaly becomes completely unresponsive on the adjoining duricrust, despite being adjacent to the Oko West orebody.

In contrast, the W3 soil anomaly is the first time at SOKO in which an anomaly has been picked up through the duricrust, albeit showing some areas of masking. The W3 target showing a response despite being right over a duricrust is incredibly encouraging and a testament to the strength and prospectivity of the target. W3 target measures ~2.1km in strike extent, representing a high priority blind target sitting below the duricrust.

South Oko Targets

The first batch of infill and extensional soil sampling at the W1 Target within SOKO materially expanded the geochemical footprint to a contiguous >100ppb Au anomaly measuring ~1.9km in strike length and up to 800m in width. This second batch has defined a second large scale coherent geochemical target measuring ~2.1km in strike extent. Currently, with this batch of assays complete, SOKO has grown to identify[23]:

- **Two large scale coherent geochemical targets, including the largest coherent >100ppb Au soil anomaly on the Oko Shear Contact, both aligning with chargeability/resistivity corridors – W1, W3**
- **Four prominent chargeability targets – W1-C, W2-C, W3-C, W4-C**
- **One resistivity target – W1-R**
- **Resistivity corridor aligned with chargeability highs and soil anomalies – A highly prospective target corridor indicating a potential sulphidized and silicified margin and geochemical footprint**

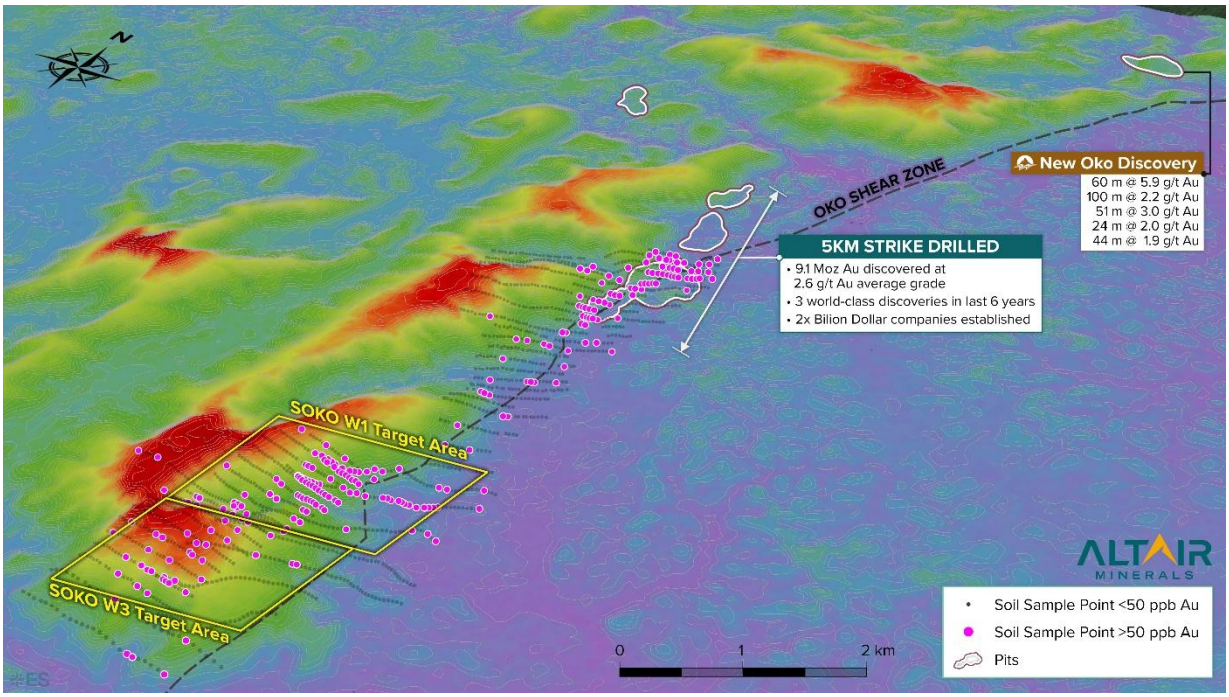

Figure 3: *Topographic perspective view across the Oko region with ALR soil sample results to date alongside previously reported soil sampling program within the B-Horizon completed by GMIN. Key structural control of Oko Shear Contact shown alongside pit outlines for deposits and discoveries made across this distinct structural control. East of Oko Shear = Granitoid Oko Pluton. West of Oko Shear = Greenstone belt, seen by distinct change in topographical character. "Pits" refer to MRE Pit design outlines from PEA/FS studies conducted by neighbouring assets. Note due to 3D perspective view, scale only applies in the NE direction its orientated in.*[1,2,3,4,5,9,10,11,12,22]

Figure 3 and 4 highlights the pronounced clustering of anomalous soil samples within the W1 and W3 Target area, positioned at a clear contact between two distinct geological units – the Oko Shear Contact – defined by the abrupt colour contrast. As seen in the setting at Oko West, a strong amalgamation of soil anomalies adjacent to the Oko Shear Contact was observed directly above the mineralised body, reinforcing the significance of geochemistry aligning with structural and lithological contacts within this corridor.

Currently Altair believes there are two possible target models which resolves the prominent and abrupt geochemical responses from the W1 and W3 Targets (seen in Figure 3 above):

- **The geochemical response is an anomalous halo resulting from in-situ mineralisation and potential emplaced bodies sitting directly below or adjacent to the W1 & W3 target.**
- **The geochemical response has been a result of soils eroded from the higher elevations further west of the W1 & W3 Target, with the potential emplaced mineralisation bodies sitting below the duricrust to the west.**

Both exploration models are aimed to be thoroughly tested through RAB drilling commencing April and subsequent diamond drilling. In any case, there is a remarkable and stark geochemical response present at SOKO on both target areas, which as seen along the Oko Shear Contact to date – doesn't tend to occur in a void without a proximal deposit.

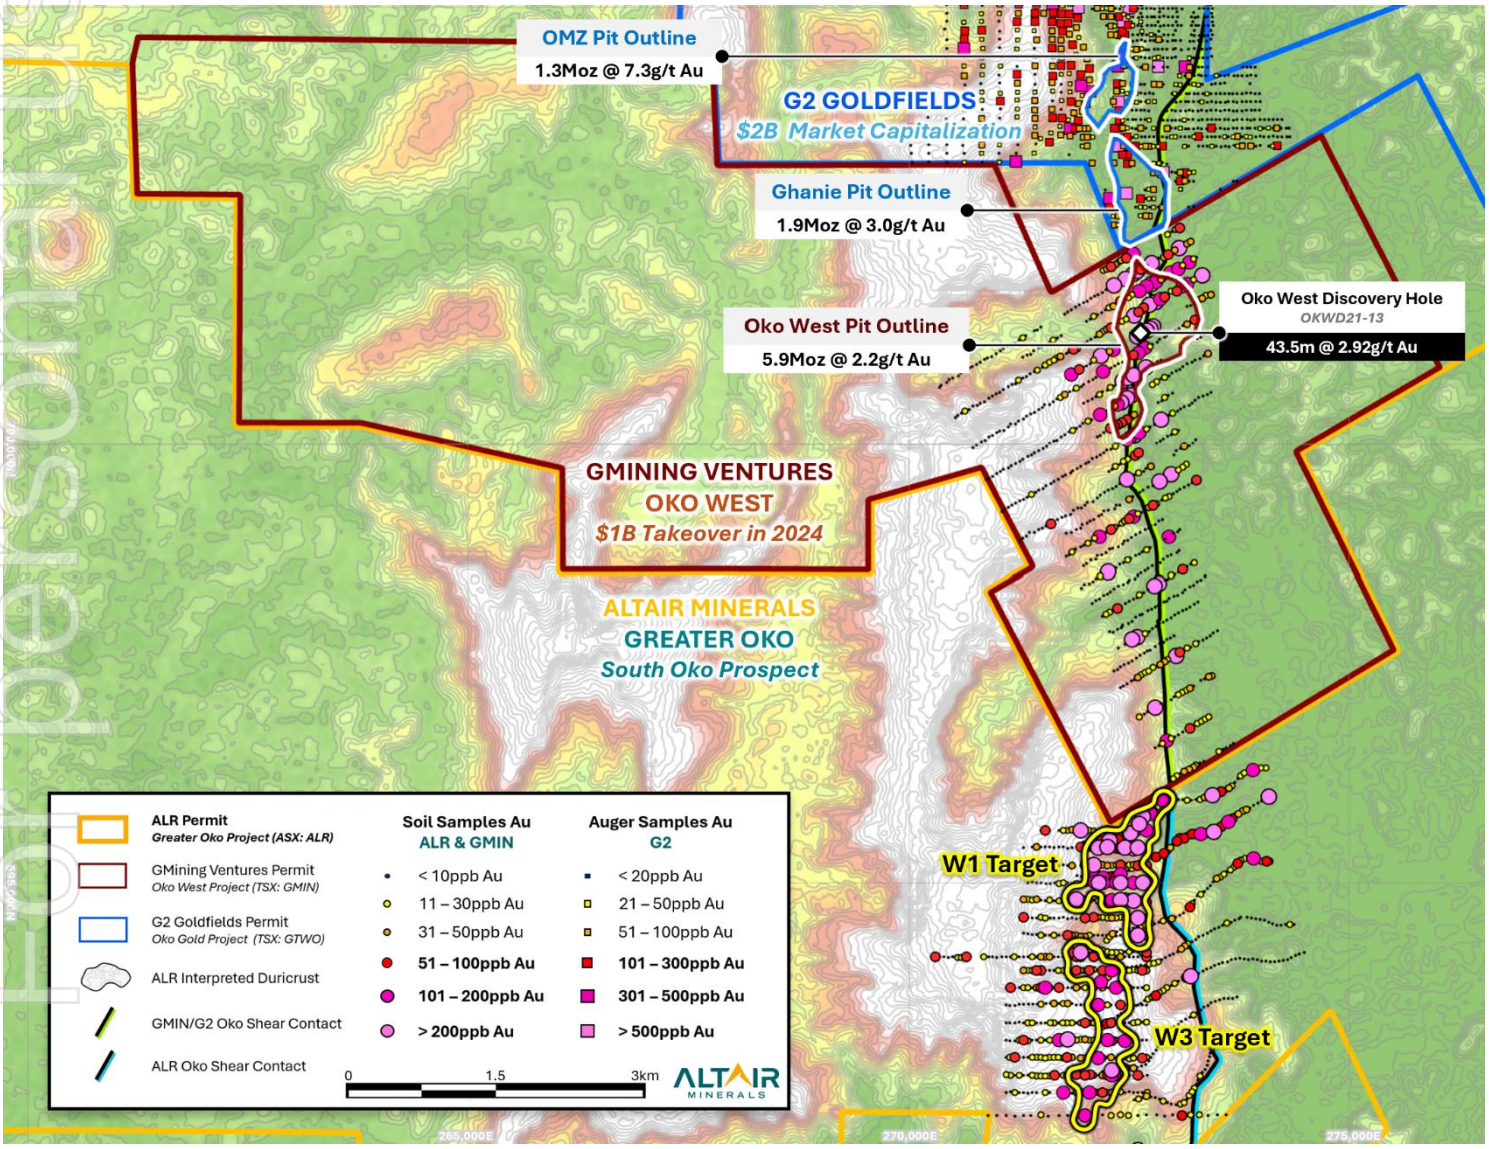

Figure 4: *Plan view of Altair South Oko area in proximity to neighbouring deposits, overlaid with soil sampling data for South Oko & Oko West projects and auger geochemistry at G2 Goldfields. WGS84 UTM Zone 21N.*[1,2,3,4]

Exploration Update

Altair continues to swiftly execute through a package of exploration and development works ahead of its maiden drill campaigns at North Peters (NP) and South Oko (SOKO).

North Peters

The diamond drill rig at North Peters is ready to be moved to site and will be mobilized immediately following completion of the refurbishment and upgrade of the NP Drill Camp. Construction continues to progress expeditiously, with key remaining tasks consisting of constructing a new core shed and upgrading the office and accommodation buildings.

During the past week, Altair NED, Rob Curtis and Altair CEO, Faheem Ahmed had both visited the NP and SOKO camps alongside a geological site review to target areas with the exploration team. During the trip, the historic core shed from NP was shown to both Faheem Ahmed and Rob Curtis, with key camp buildings located adjacent to the historic core shed.

Altair is looking to facilitate the construction of a new core shed, notwithstanding, Altair will also seek to begin recovering and relogging core from the historic shed at its earliest convenience. Drill pads at North peters have begun clearance, in anticipation of the NP Camp being complete and commencement of drilling in April.

Figure 5: *Location of North Peters camp buildings adjacent to historic core shed. View looking out of the office unit.*

Figure 6: *Close up of historic core shed from historic drilling at North Peters between 2005 – 2010 and core trays.*

South Oko

Geochemical programs consisting of trenching and soils continue to progress at SOKO, with over 1,000 samples pending assays. During the visit by Altair Australia management at SOKO, the Oko Shear Contact between the felsic granite and greenstone belt was identified – as seen in Figure 7 below. This observation has acted as further confirmation that the positioning of the outcropping Oko Shear Contact identified aligns with current mapping and geophysics.

Auger drilling has completed a further four lines with 40 holes pending assays, majority of which was focused on the felsic granite unit, east of the contact. The purpose of these initial auger holes was two-fold, to identify the ideal auger tool and motor configurations to swiftly penetrate various lithological units and to complete initial testing on the felsic unit. The various effective configurations will now be utilized to focus auger drilling through the key W1 and W3 targets. Auger drilling allows geochemical testing beneath the laterite and soil layers into the top of the saprolite horizon, becoming an effective tool in identifying in-situ anomalies.

Guyana

Guyana has rapidly emerged as a premier gold jurisdiction, drawing increasing attention from major players in the gold exploration space. As the last truly pro-mining and politically stable country within the Guiana Shield, it hosts an extension to West African geology, consisting of the same Birimian Greenstone that has underpinned world-class gold discoveries across West Africa — including in Ghana, Ivory Coast, and Burkina Faso. However, unlike its African counterparts, Guyana remains significantly underexplored.

The 590km^2 contiguous landholding itself within Greater Oko not only represents an irreplicable landholding but is also positioned within one of the most prominent and emerging greenstone belts globally, and 1.5km away from a 5.9Moz discovery, which is expected to go into production over the next 18 months. Recent exploration success by groups such as G2 Goldfields ($2.0B Market Capitalisation) and Reunion Gold (GMIN took over for $1Billion in 2024) has already validated the region's untapped potential, establishing multiple Tier-1 discoveries made from grassroot exploration campaigns.[1,2,4]

Current public companies actively drilling across the Guiana Shield include:

- **G2 Goldfields:** $2.0Billion Market Capitalization[4]
- **Reunion Gold:** $1Billion Takeover by GMining Ventures in 2024[2]
- **Greenheart Gold:** $182M Market Capitalization[16]
- **Founders Metals:** $606M Market Capitalization[17]
- **OMAI Gold Mines:** $1.4B Market Capitalization[18]

For and on behalf of the board:

Faheem Ahmed – CEO

This announcement has been approved for release by the Board of ALR.

About Altair Minerals

Altair Minerals Limited is listed on the Australian Securities Exchange (ASX) with the primary focus of investing in the resource sector through direct tenement acquisition, joint ventures, farm in arrangements and new project generation. The Company has projects located in South Australia, Western Australia and Queensland with a key focus on its Olympic Domain tenements located in South Australia. The shares of the company trade on the Australian Securities Exchange under the ticker symbol ALR.

Streamline Statement

Altair confirms that it is not aware of any new information or data which affects the exploration results and information which has been previously disclosed and cross-referenced and included within this announcement.

Competent Persons Statement

The results referenced in this release have been prepared with information compiled by Mr Robert Wason BSc (Hons) Geology, MSc (Mining Geology), a Competent Person who is a Member of the Australasian Institute of Mining and Metallurgy. Mr Wason is an employee of Mining Insights. Mr Wason has sufficient experience relevant to the style of mineralisation and type of deposit under consideration to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Wason consents to the inclusion of these exploration results based upon the information in the form and context in which it appears.

Proximity Statement

This announcement contains references to exploration results derived by other parties either nearby or proximate to The Greater Oko Project and includes references to topographical or geological similarities to that of the ALR Project. It is important to note that such discoveries or geological similarities do not in any way guarantee that the Company will have any success or similar successes in delineating a JORC compliant Mineral Resource on the Greater Oko Project, if at all.

Forward Looking Statement

This announcement contains 'forward-looking information' that is based on the Company's expectations, estimates and projections as of the date on which the statements were made. This forward-looking information includes, among other things, statements with respect to the Company's business strategy, plans, development, objectives, performance, outlook, growth, cash flow, projections, targets and expectations, mineral reserves and resources, results of exploration and related expenses. Generally, this forward-looking information can be identified by the use of forward-looking terminology such as 'outlook', 'anticipate', 'project', 'target', 'potential', 'likely', 'believe', 'estimate', 'expect', 'intend', 'may', 'would', 'could', 'should', 'scheduled', 'will', 'plan', 'forecast', 'evolve' and similar expressions. Persons reading this announcement are cautioned that such statements are only predictions, and that the Company's actual future results or performance may be materially different. Forward-looking information is subject to known and unknown risks, uncertainties and other factors that may cause the Company's actual results, level of activity, performance or achievements to be materially different from those expressed or implied by such forward-looking information.

Table 1: *South Oko Soil Sample assays. Coordinates in WGS84, UTM Zone 21N.*

APPENDIX B: SOKO Soil Sample Location Map

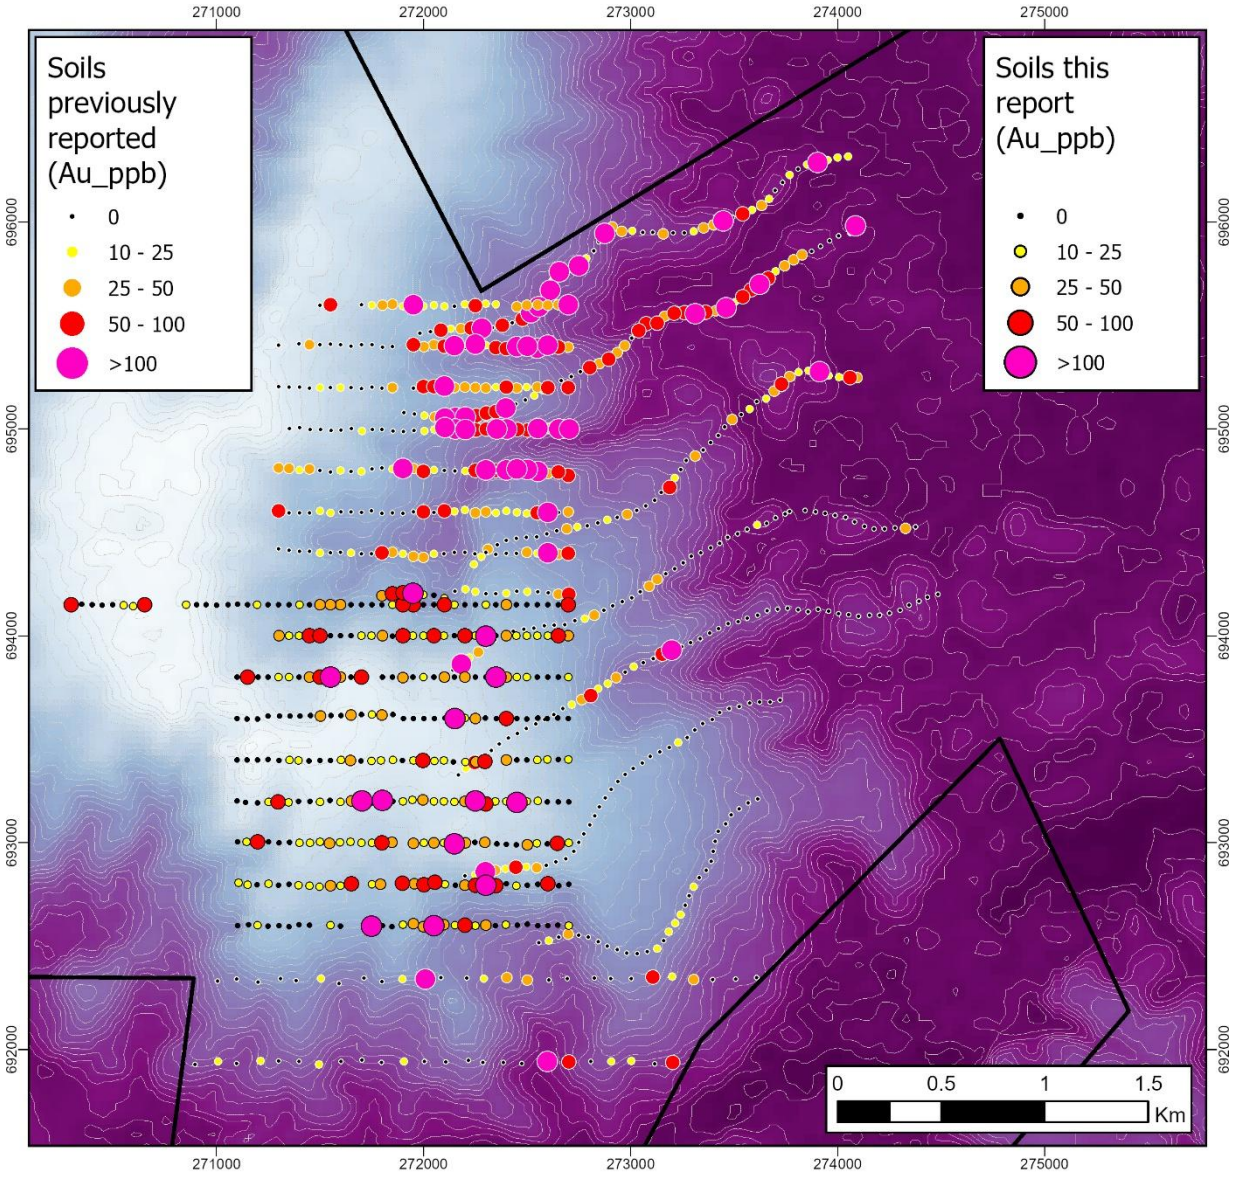

Figure 11: *Visual location points of all soil samples at SOKO reported to date. WGS84, UTM Zone 21N.*

JORC Code, 2012 Edition – Table 1

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• A total of 305 soil samples were collected during the program. • Soil sample collection was conducted with the use of fence diggers (boca de lobo), with the A-Horizon (organic material rich soil, 20 cm depth) discarded, and the B-Horizon (20 to 50 cm depth) used as sample media. • Industry standard soil samples were taken so that each sample was representative of the target horizon at each location point and that no sampling bias was introduced to the process.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• No drilling results are reported in this release
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• No drilling results are reported in this release.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the*	• No drilling results are reported in this release. • Surface geochemistry samples were qualitatively described, photographed, and recorded in a geospatial database.

Criteria	JORC Code explanation	Commentary
	relevant intersections logged.	
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• An average 2 to 3 kilograms of samples were collected within the soil's B-Horizon. • These collected samples were subsequently bagged, tagged and submitted to Actlabs Guyana assay laboratory for analysis.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• Samples were analysed at Actlabs, Guyana following industry best practice standards. Routine QA/QC processes at the Actlabs, including insertion of one blank and one standard within the eight samples, as per standard analytical procedures. • Samples were crushed to 80% passing 2mm, riffle split to 250g and pulverised to 95% passing -150 mesh and split for a 30g Fire Assay (30FA) with AA finish or samples which assayed >3g/t Au (30FA), were re-assayed with a gravimetric finish.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• No umpire analysis has been performed. • N/A - No drilling reported. • Field data is captured digitally and in field notebooks by hand to ensure a backup of information.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• Location for the sample points was determined by handheld GPS. • Location for all sampling data is based on WGS84, Zone 21 North UTM datum.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.*	• Surface geochemistry sampling will not be used in resource estimation. • Data spacing is sufficient for preliminary exploration work designed to assess the mineral prospectivity potential of the project area.

Criteria	JORC Code explanation	Commentary
	• *Whether sample compositing has been applied.*	
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• No drilling results are reported in this release.
Sample security	• *The measures taken to ensure sample security.*	• The samples were placed into bags and sealed and then put into larger sacks which are then sealed with red tags. • An appropriately documented chain of custody form and letter are given to the driver of the truck that then transports the secure samples directly to Actlabs Guyana.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• No external audits or reviews are incorporated into this report.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Altair has the right to earn up to 70% of the Greater Oko Project, subject to conditions precedent. • There are no other material issues affecting the tenements. • All tenements are currently in good standing and have been legally validated by local lawyer specialising in the field.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• Historic exploration including surface geochemistry and drilling has been previously announced on 5th August 2025, 26th August 2025, 8th Jan 2026 and 15th Jan 2026.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The project area is underlain by Precambrian rocks of the Barama-Mazaruni Group with the bedrock belonging to the Cuyuni Formation. • The Cuyuni Formation, sedimentary and volcanic rocks, were compressed and metamorphosed during the Akawaian Episode and Trans-Amazonian Orogeny to form part of a greenstone belt. • Previous exploration has demonstrated the presence of an NNE-SSW trending

Criteria	JORC Code explanation	Commentary
		weathered, saprolitized shear zone with high-grade gold mineralization.
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• No metal equivalent values are reported.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• True widths are not known. • The true extent and geometry of the mineralisation is not known yet.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Appropriate maps and sections are included in the main body of this announcement.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Reporting is considered to be balanced. • All relevant and material exploration data for the target areas has been reported or referenced.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• All relevant and meaningful exploration data received and validated by Altair has been included in this release.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• Detailed geochemistry should be carried out to determine trends of known mineralised zones and to delineate high grade trends within the identified mineralised zones. • Further drilling is recommended to test step-out and depth extensions to the currently known mineralisation, and to infill some areas of the known body to increase the confidence in support of a resource estimate. • Any further exploration activity will depend on assessment of current results.
