Lake Johnston Lithium Project, WA

Extension of high-grade lithium soil anomalies shows potential for significant hard rock source

Given these highly promising results, planning is underway for a maiden drilling program in the heart of this well-recognised lithium belt

HIGHLIGHTS

- **High grade +200 ppm Li_2O anomalies extended from previous program**
- **Extensive +100 ppm Li_2O anomalies identified over the project area**
- **Exploration programs planned to identify the hard rock source**

Kingsland Minerals (Kingsland, ASX:KNG) is pleased to announce that a major soil sampling program has expanded the high-grade lithium anomalies at its Lake Johnston lithium project[1].

The strong results are considered significant because they provide more evidence of a hard rock lithium source nearby.

In light of this potential, planning is now underway for a maiden drilling program at Lake Johnston to target lithium mineralisation in fresh rock.

The project area hosts greenstones which are interpreted to be part of the nearby Lake Johnston Greenstone Belt, a proven source of hard rock lithium and nickel mineralisation.

The current program covered most of the 890sqkm of the Lake Johnston project. A grid of 200m EW and 1,000m NS covered the project as illustrated in Figure 2.

Kingsland Managing Director, Richard Maddocks said: "*These are very promising results because they provide more evidence of the potential presence of lithium-bearing lithologies within our Lake Johnston tenement package. Historical drilling targeting nickel has intersected pegmatitic textures and greenstone lithologies in our tenements and we have confirmation of lithium mineralisation in the wider Lake Johnston area with recent successful drilling by other companies following up similar soil anomalism.*
We are now in the early stages of planning a drilling program and/or geophysical surveys to assess the fresh rock geology and determine the source of the high-grade surface lithium anomalies".

Previous soil sampling completed in 2024 delineated significant lithium anomalies.[1] These anomalies suggested the potential for a hard rock source of the lithium. Historic drilling conducted in 2008 by previous explorers targeting nickel mineralisation intersected pegmatite dykes but lithium and associated elements were not assayed at the time.[2] A more thorough program was designed to assess the project wide potential for lithium mineralisation. Figure 2 shows the coverage of the most recent program. Figures 3 to 6 show detail of the soil sample results and contouring of higher grade anomalies of 100ppm and 200ppm Li_2O. Figures 4 and 6 overlie the Li_2O contours over the GSWA (Geological Survey of Western Australia) Total Magnetic Intensity (TMI) surveys. There are indications that the surface contours reflect underlying structure and/or lithologies. Drilling programs are being designed to investigate if such an association exists. Appendix C contains details of the soil samples taken to date.

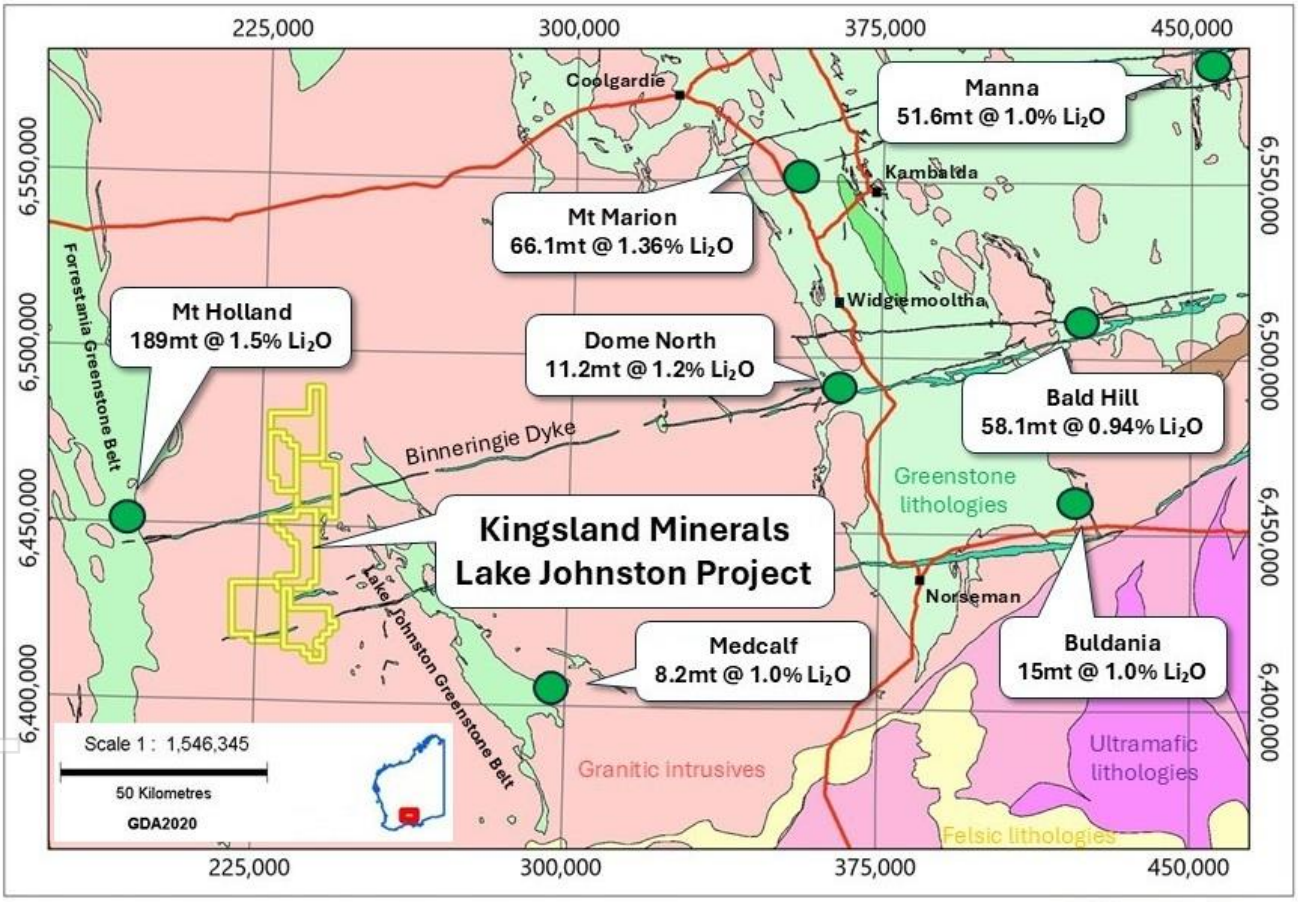

Figure 1: Location of Kingsland Lake Johnston Project with major lithium deposits[3]

Figure 1 shows the location of the Lake Johnston project in context with regional geology and the location of known lithium deposits. It should be noted that the Bald Hill, Dome North and Mt Holland

[2] refer to ASX announcement 'Lake Johnston Lithium Project Update' released on 11 January 2024

[3] See Appendix B for lithium deposit mineral resource details. Background geology from GSWA 1:500,000 Tectonic units

lithium deposits are all relatively close to the Binneringie Dyke. This dyke also passes through Kingsland's Lake Johnston project and provides a potential target for future exploration.

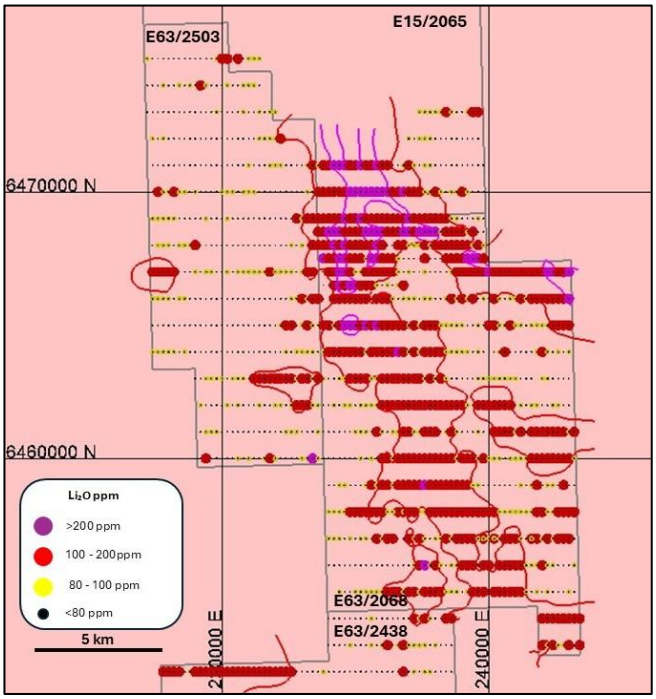

Figure 3: Soil sampling on northern project area showing sample locations and results

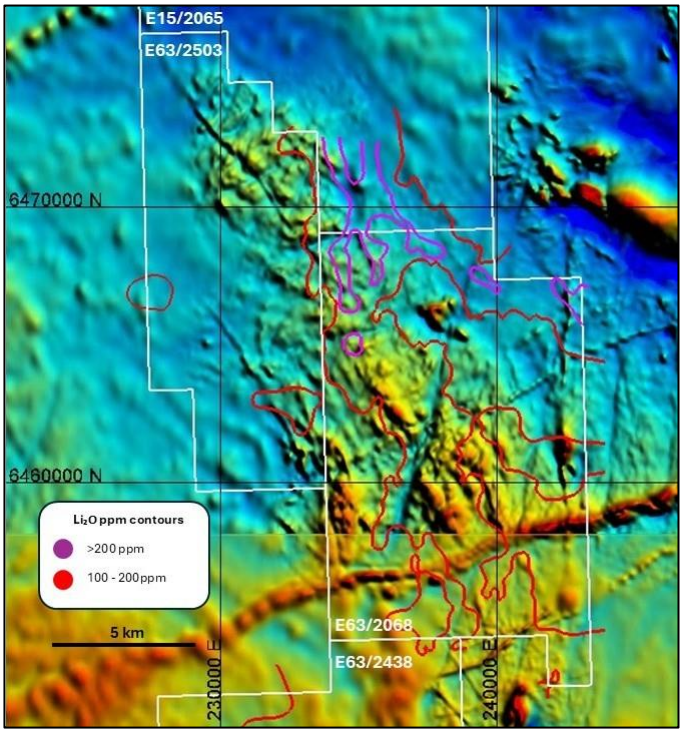

Figure 4: Soil sampling on northern project area showing Li_2O contours (overlying total magnetic intensity GSWA 1:250,000)

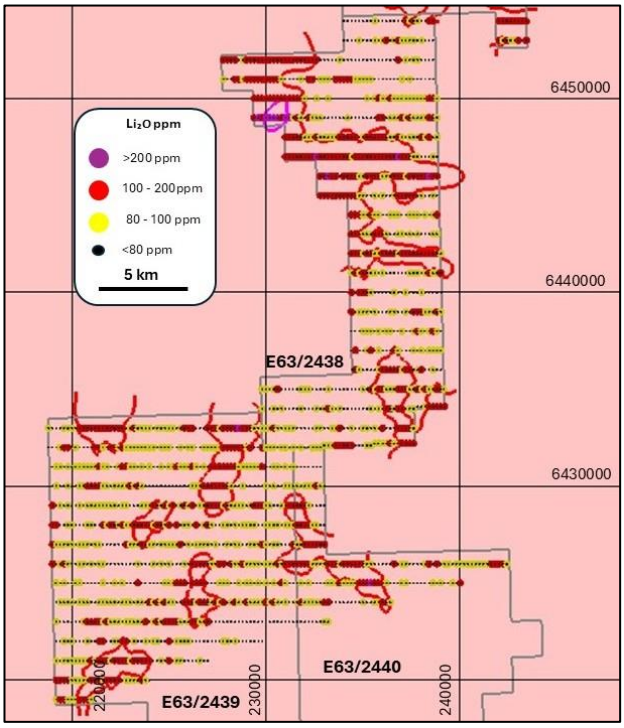

Figure 5: Soil program on southern project area showing sample locations and results

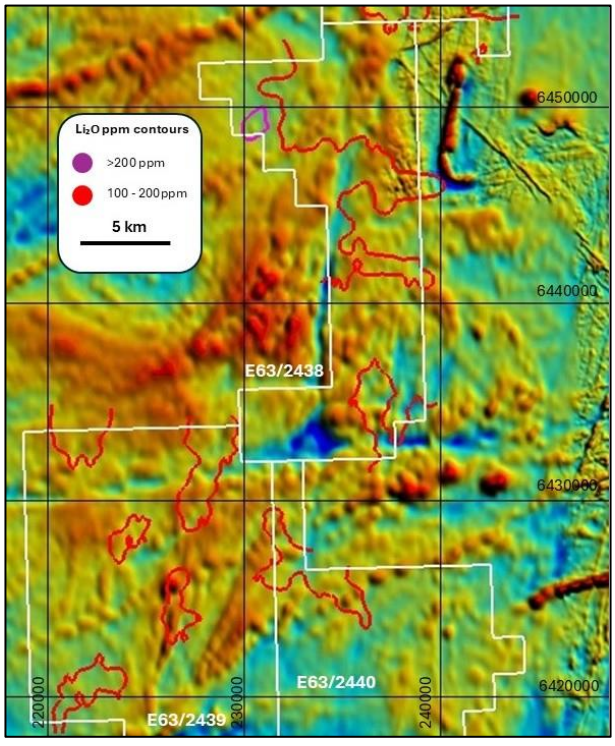

Figure 6: Soil sampling on southern project area showing Li_2O contours (overlying total magnetic intensity GSWA 1:250,000)

A total of 3,099 soil samples have been taken on a 1,000m X 200m grid over the two campaigns, the one completed recently and one completed in 2024 and previously reported.[4] A small area to the north of E63/2068, where high grade +200ppm Li_2O anomalism was detected, was sampled on a 500m X 200m grid. Samples were taken from the sieved -80 mesh (0.18mm) fraction collected between 5-30cm below surface. Assaying was conducted by Labwest of Perth with samples analysed using the Ultrafine method. A suite of 65 elements was analysed.

Figure 6 shows the magnetics from the GSWA website indicating structural complexity within the project area. It is known from historic drilling that magnetic highs in E63/2068 are related to mafic/ultramafic greenstone lithologies.

The results of this program will be used to plan future drilling programs aimed at discovering hard rock sources of the lithium anomalism.

Competent Person Statement

The information in this report that relates to Exploration Results is based on information compiled by Richard Maddocks, a Competent Person who is a Fellow of The Australasian Institute of Mining and Metallurgy. Richard Maddocks has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Richard Maddocks consents to the inclusion in the report of the matters based on his information in the form and context in which it appears. Richard Maddocks is a full time employee of Kingsland Minerals Ltd and holds securities in the company.

Information regarding previous exploration at the Lake Johnston Project is extracted from the reports 'Lake Johnston Lithium Project Update 'created on 11 January 2024, 'Large high grade lithium soil anomaly at Lake Johnston' created on 21 February 2024, 'High grade lithium anomaly at Lake Johnston' created on 3 April 2024 and 'Kingsland starts new exploration program at Lake Johnston' created on 3 March 2026. These reports are available to view on www.kingslandminerals.com.au or on the ASX website www.asx.com.au under ticker code KNG. The company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements and, in the case of estimates of Mineral Resources or Ore Reserves, that all material assumptions and technical parameters underpinning the estimates in the relevant market announcements continue to apply and have not materially changed. The company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

THIS ANNOUNCEMENT HAS BEEN AUTHORISED FOR RELEASE ON THE ASX BY THE COMPANY'S BOARD OF DIRECTORS

About Kingsland Minerals Ltd

Kingsland Minerals Ltd is an exploration company with assets in the Northern Territory and Western Australia. Kingsland's focus is exploring and developing the Leliyn Graphite Project in the Northern Territory. Leliyn is one of Australia's most significant graphite deposits with an Inferred Mineral Resource of 194.6mt @ 7.3% Total Graphitic Carbon containing 14.2mt of graphite. A recently completed scoping study indicted the potential for profitable production of graphite concentrate. In addition to Leliyn, Kingsland owns the Cleo Uranium Deposit in the Northern Territory. Kingsland drilled this out in 2022 and estimated an Inferred Mineral Resource containing 5.2 million pounds of U_3O_8. The Lake Johnston Project in Western Australia has historic nickel drill intersections and is also prospective for lithium mineralisation. Kingsland has a portfolio of very prospective future energy mineral commodities.

Appendix A: JORC Tables

Section 1: Sampling Techniques and Data - Lake Johnston Lithium Project

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• Samples were collected on a 500m (NS) X 200m (EW) grid or a 1000m (NS) X 200m (EW) grid. • Sample weights for soil samples ranged between 200-300g, • The sieved -80 mesh fraction was collected between 5-30cm below surface and secured in individually numbered paper bags and secured poly weave sacks
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• No drilling techniques were used.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• No drilling was conducted
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean,*	• Soil samples were not geologically logged. • The samples were taken at very shallow depths so are considered very highly weathered

Criteria	JORC Code explanation	Commentary
	channel, etc) photography. • *The total length and percentage of the relevant intersections logged.*	
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• Approximate 0.2 to 0.3kg samples were taken each sample. • All samples were taken dry • The sieved -80 mesh fraction was collected between 5-30cm below surface and secured in individually numbered paper bags and secured poly weave sacks
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• Samples were submitted to Labwest of Perth with samples analysed using the Ultrafine method • The <2um fraction is separated from the submitted soil or regolith sample. This is achieved by settling, using water and a dispersant. The clay fraction is digested in aqua-regia under high pressure and temperature using microwave apparatus. Elemental concentration is determined using a combination of ICP-MS & ICP-OES. • Multi-elements include: Au, Ag, Al, As, B, Ba, Be, Bi, Br, Ca, Cd, Ce, Co, Cr, Cs, Cu, Dy, Er, Eu, Fe, Ga, Gd, Ge, Hf, Hg, Ho, I, In, K, La, Li, Lu, Mg, Mn, Mo, Na, Nb, Nd, Ni, Pb, Pd, Pr, Pt, Rb, Re, S, Sb, Sc, Se, Sm, Sn, Sr, Ta, Tb, Te, Th, Ti, Tl, Tm, U, V, W, Y, Yb, Zn, Zr. • The assay technique is considered appropriate for the style of mineralisation.. • No standards, blanks or field duplicated were submitted
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• Assays and data entry have been verified by company geologists.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.*	• Sample locations were surveyed with a hand held GPS with +/- 5m accuracy. • Sample locations and maps in this announcement are in MGA z51 grid.

Criteria	JORC Code explanation	Commentary
	• *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• This sampling was done to establish the presence of any lithium mineralisation. • This data is not considered appropriate for the estimation of Mineral Resources
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• The orientation of any pegmatitic intrusives is not known.
Sample security	• *The measures taken to ensure sample security.*	• Samples were delivered to the lab by contractors on Kingsland behalf.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• No audits or reviews of sampling techniques have been undertaken.

Section 2: Reporting of Lake Johnston Lithium Project Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a license to operate in the area.*	• The Lake Johnston Lithium Project is located on granted tenements E63/2068, E63/2438, E63/2439, E63/2440, E63/2503 and E15/2065. These tenements are 100% owned by Kingsland Gold Pty Ltd a fully owned subsidiary of Kingsland Minerals Ltd. Heritage Agreements for exploration activities have been entered into with relevant Native Title parties.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• Previous exploration has targeted nickel and gold. Some scattered soil sampling has been completed along with some RC drilling. Nickel exploration was conducted by Western Areas
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The project area lies in the southern portion of the Southern Cross Province between the Lake Johnston greenstone belt and the main Forrestania greenstone belt of the Archaean Yilgarn Craton. The northwest trending belt extends over a strike length of approximately 35 km and a maximum width of 8 km. • Kingsland's Lake Johnston Project

Criteria	JORC Code explanation	Commentary
		is underlain by numerous granitic rocks of Archaean age and basement granitoids and gneiss, frequently incorporating rafts of highly deformed and metamorphosed greenstone lithotypes. These small isolated greenstones rafts are the target of nickel exploration • Two prominent Proterozoic dykes cross the project area, the largest being the Binneringie Dyke which lies roughly along the Hyden Norseman road and the Jimberlana Dyke passing through E63/2440.

Drill hole information	• *A summary of all information material to the under-standing of the exploration results including a tabulation of the following information for all Material drill holes:*
	  • *easting and northing of the drill hole collar*
	  • *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar*
	  • *dip and azimuth of the hole*
	  • *down hole length and interception depth*
	  • *hole length*
	• *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*
		• Sampling information is included in this announcement

Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• No data aggregation has been conducted. Assays are reported as they were sampled.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').*	• This relationship is not known due to the early stage of the project
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Relevant diagrams have been included within the main body of text.

Criteria	JORC Code explanation	Commentary
Balanced Reporting	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced avoiding misleading reporting of Exploration Results.*	• The competent person deems the reporting of these results to be balanced.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples - size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• The underlying total magnetic intensity TMI images contained in Figures 4, 6 and 7 were sourced from the Geological Survey of Western Australia on the website https://geoview.dmp.wa.gov.au . • There is no other substantive data to report. Exploration at Lake Johnston is at an early stage with only limited historical exploration data relevant to lithium mineralisation
Further work	• *The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large- scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• Geochemical surveys over the project area and public release geophysical data will be used to generate targets for more focussed exploration. • Additional soil sampling and/or air-core drilling will be planned to delineate additional lithium anomalism
