

**Bramaderos Gold-Copper Project, Southern Ecuador**

# Bramaderos continues to grow as two more holes intersect mineralisation outside the 3.6Moz<sup>1</sup> resource

All 10 holes assayed so far in the new drilling program have returned long mineralised intersections, supporting the strategy to convert the big Exploration Target to resources

## Key Points

- Further wide zones of gold-copper mineralisation in the latest two holes at Bramaderos
- The latest two Porotillo holes include Sunstone's first hole (PTDD004) into the north-west domain at Porotillo. Porotillo is adjacent to the pit-constrained Bramaderos Mineral Resource, indicating potential to grow the resource within this cluster
- The 4<sup>th</sup> hole at Porotillo (PTDD004) drilled 116m at 0.57 g/t Au-Eq<sup>2</sup> (0.36 g/t Au, 0.12 % Cu), including:
  - 92m at 0.66 g/t Au-Eq<sup>2</sup> (0.42 g/t Au, 0.14 % Cu), includes
  - 20m at 0.91 g/t Au-Eq<sup>2</sup> (0.66 g/t Au, 0.15 % Cu)
- The 5<sup>th</sup> hole at Porotillo (PTDD005) drilled 99m at 0.33 g/t Au-Eq<sup>2</sup> (0.19 g/t Au, 0.08 % Cu), including:
  - 18.7m at 0.54 g/t Au-Eq<sup>2</sup> (0.32 g/t Au, 0.13 % Cu) and 15.6m @ 0.54 g/t Au-Eq<sup>2</sup> (0.37 g/t Au, 0.10 % Cu)
- Assays received from the holes at Porotillo reinforce the extensive mineralisation encountered in the five trenches PO-1 to PO-5 and expand the area of mineralisation being defined by drilling
- Sixteen holes of a 28-hole program have now been completed, with additional assays pending
- The drill program aims to upgrade to resources a significant portion of the Exploration Target in the Copete-Porotillo complex, which is 135–180Mt at 0.40–0.60 g/t AuEq<sup>2</sup> for 1.7 to 3.5 Moz AuEq<sup>1,2</sup>. The potential quantity and grade of the Exploration Target is conceptual in nature. There has been insufficient exploration to estimate a Resource for the reported exploration target areas. It is uncertain if further exploration will result in the estimation of a Resource

Sunstone Managing Director Patrick Duffy said: "These latest results, and those from the previously announced eight holes, are entirely consistent with our strategy to grow the 3.6Moz resource by converting the exploration target.

"The results continue to demonstrate that we have a very good understanding of the controls on the mineralisation and the geometry, meaning we are now in that exploration sweet spot where the returns on our drilling are outstanding.

"This program now comprises 28 planned holes, giving us ample opportunity to continue proving up substantial new mineralisation ahead of the next Bramaderos resource update later this year.

ASX ANNOUNCEMENT

“There are very few undeveloped gold-copper resources of this magnitude with such a rapid growth outlook in a highly desirable location.

“Bramaderos is clearly one of these, and we have no doubt that the true value of our asset will become increasingly recognised.”

Sunstone Metals Ltd (ASX: STM) is pleased to announce that it continues to intersect long intervals of gold and copper mineralisation in the third set of reported drill holes of the current drill program across the Porotillo, Copete and Melonal porphyry systems within the Bramaderos project.

These latest results from Porotillo follow the strong intersections returned in the first eight holes at Copete, Melonal and Porotillo (see ASX releases dated 14 April 2026, 4 May 2026 and 14 May 2026).

**Figure 1:** The cluster of five porphyry gold-copper systems in the Bramaderos concessions (Brama, Alba, Melonal, Copete and Porotillo), and showing the area where drilling is underway at Porotillo and Copete to grow the Bramaderos Mineral Resource. Background colour shading is gold in soils. Copete-Porotillo Exploration Target: 135–180Mt at 0.40–0.60 g/t AuEq<sup>2</sup> for 1.7 to 3.5 Moz AuEq<sup>1,2</sup>; Brama-Alba-Melonal-Limon Exploration Target: 180–325Mt at 0.41–0.74 g/t AuEq<sup>2</sup> for 2.4 to 7.7 Moz AuEq<sup>1,2</sup>

ASX ANNOUNCEMENT

1. Drilling at Porotillo

The 5,000m diamond drill program at Copete, Porotillo, and Melonal is now focused on expanding drill coverage across the Porotillo porphyry system, with two drill rigs operating in the northwest and southeast sectors of the system.

In addition to holes CPDD001 to 004 at Copete and MEDD003 at Melonal, holes PTDD001 to PTDD011 have been completed at Porotillo, while PTDD012 and PTDD013 are in progress (see Figure 2).

**Figure 2:** Status of drilling at Copete and Porotillo. Fifteen completed holes (CPDD001-004 and PTDD001-011), and showing active holes PTDD012 and PTDD013. Additional planned holes are shown by the 10 thin blue traces. Planned drilling is being progressively optimised as core logging is completed and assays are received and reconciled with magnetic and geological datasets. Dashed black outlines define the approximate surface boundary of the core of the mineralised areas that are being drilled for resource expansion on the Bramaderos project.

Assays for holes PTDD004 and PTDD005 have been received. Hole PTDD004 was collared within the northwest mineralised domain at Porotillo and drilled towards the northwest (Figure 2). PTDD005 was collared on the southern margin of the southeast mineralised domain (Figure 2). Both holes intersected a similar series of high-level intrusion breccias as were intersected by previously announced holes PTDD001 to PTDD003, and were both located above a deeper domain of magnetic anomalism. Disseminated copper sulphides logged in the holes comprise chalcopyrite and lesser bornite of hypogene origin, plus chalcocite and minor native copper, tenorite and cuprite of supergene origin.

**ASX ANNOUNCEMENT**

A cross-section through hole PTDD004 (assays received) and passing through holes PTDD006, PTDD007, PTDD008 and PTDD010 (for which assays are pending) is shown in Figure 3. The compilation of lithological logging across these five holes reinforces Sunstone’s emerging geological interpretation that the environment represents the high-level carapace of a series of porphyry stocks, with stockwork veining both over-printing and being brecciated by widespread and multiple generations of high-level intrusion breccias that are emplaced into a wallrock intrusive sequence dominated by early mineral quartz diorite.

Key intersections in all five of the first holes drilled by Sunstone at Porotillo are listed in Table 1 below. These first five holes drill holes (of 20 holes planned at Porotillo) are listed in Tables 1 and 2 below.

Drillhole		From (m)	To (m)	Length (m)	Au-Eq (g/t) <sup>2</sup>	Au (g/t)	Cu (%)	Ag (g/t)	Mo (ppm)

<b>PTDD003</b>	Porotillo	631543	9547846	882	155	-60	150.15
<b>PTDD004</b>	Porotillo	631392	9548103	851	300	-50	166.85
<b>PTDD005</b>	Porotillo	631543	9547856	882	315	-50	202.28

**Table 2:** Drill hole locations for completed holes at Porotillo (2026).

Samples from holes PTDD006, PTDD007, PTDD008, PTDD009 and PTDD010 are currently in the laboratory for analysis, while samples from the current hole PTDD011 will be submitted in the next week.

Early drilling at Porotillo is focused on establishing an initial shallow resource down to around 200m, with follow-up during a second phase of drilling to infill and target the deeper magnetic body that underlies the surface mineralisation.

ASX ANNOUNCEMENT

**Figure 3:** Cross-section along the trace of holes PTDD004, 006, 007, 008 and 010 at Porotillo, illustrating the intersection of multiple generations of intrusion breccias within the carapace of an extensive underlying magnetic anomaly that is related to secondary magnetite in potassic altered rocks. The 116m-long intersection is shown in PTDD004. Assays are pending for holes PTDD006, PTDD007, PTDD008 and PTDD010.

For personal use only

## ASX ANNOUNCEMENT

**Figure 4:** Example of mineralised drillcore from hole PTDD004 at Porotillo at 44.28m depth that assayed 0.50 g/t AuEq<sup>2</sup> (0.25 g/t Au, 0.14% Cu) as labelled on the image. The copper assay is largely derived from the copper-sulphide mineral chalcocite, whose abundance is around 0.18% of the rock volume. Mineralisation occurs as disseminations and as blebs within the veins and intergrown with quartz and magnetite. Chalcocite was logged in the hand-specimen prior to assay. The specimen contains magnetite veins (Mt-veins) as fine fractures and coarser cross-cutting quartz B-veins that overprint the quartz diorite wallrock. The alteration assemblage from visual logging contains potassium-feldspar (~5%), magnetite (~6%), albite (~10%), sericite (~10%), and secondary chlorite (~20%).

## ASX ANNOUNCEMENT

### About Sunstone Metals

Sunstone Metals Limited (“Sunstone” or “Company”) is an ASX-listed mineral exploration company with two world-class gold and copper projects in Ecuador:

1. The **Bramaderos Project**, located in Southern Ecuador, contains the November 2025 Mineral Resource estimate of 220Mt at 0.50g/t AuEq for 3.6Moz AuEq<sup>1,2</sup>.

JORC Classification	Tonnage (Mt)	Au (g/t)	Cu (%)	Ag (g/t)	AuEq <sup>1</sup> (g/t)	AuEq <sup>1</sup> (Mozs)
Indicated	40	0.37	0.11	1.26	0.56	0.6
Inferred	190	0.32	0.10	1.19	0.49	2.9
<b>Total</b>	<b>220</b>	<b>0.33</b>	<b>0.10</b>	<b>1.20</b>	<b>0.50</b>	<b>3.6</b>

Additionally, the Bramaderos Project has a Porphyry Exploration Target of between 4.1Moz and 11.2Moz AuEq<sup>1,2</sup> within 315 to 505Mt at a grade between 0.41 and 0.68g/t, and the Limon epithermal gold-silver Exploration Target of between 0.9 and 1.7Moz AuEq<sup>3,4</sup> within 30 to 44Mt at a grade between 0.9 and 1.2g/t.

The potential quantity and grade of the Exploration Targets is conceptual in nature. There has been insufficient exploration to estimate a Resource for the reported exploration target areas. It is uncertain if further exploration will result in the estimation of a Resource.

2. The **El Palmar Project** is located in northern Ecuador, 60km north-west of Ecuador’s capital Quito. The property sits on the regionally significant Toachi Fault Zone that hosts a number of, which hosts several world-class copper porphyry systems. The Project has both at-surface and deeper porphyry gold-copper systems and an initial Mineral Resource estimate of 64Mt at 0.60g/t AuEq for 1.2Moz AuEq<sup>5,6</sup>.

JORC Classification	Tonnage Mt	Average Grade					Material Content			
		AuEq <sup>6</sup> (g/t)	Au (g/t)	Ag (g/t)	Cu (ppm)	Cu (%)	AuEq <sup>6</sup> (Koz)	Au (Koz)	Ag (Koz)	Cu (Kt)
Indicated	5	0.63	0.42	0.81	1,456	0.15	100	100	100	7
Inferred	59	0.59	0.40	0.65	1,290	0.13	1,100	700	1,200	70
<b>Total</b>	<b>64</b>	<b>0.60</b>	<b>0.41</b>	<b>0.66</b>	<b>1,301</b>	<b>0.13</b>	<b>1,200</b>	<b>800</b>	<b>1,300</b>	<b>80</b>

Additionally, the El Palmar Project has a porphyry Exploration Target of between 15Moz and 45Moz AuEq<sup>5,6</sup> within 1.0 to 1.2Bt at a grade between 0.3 - 0.7g/t gold and 0.1 – 0.3% copper.

A flyover video of the two Projects can be viewed here: [CLICK LINK](#)

### Strategy

The porphyry projects at Bramaderos and El Palmar have the potential to evolve into multi-decade gold-copper mining centres. At Bramaderos, a Scoping Study has been completed which indicated project viability and large growth potential. Sunstone plans to further grow the Bramaderos resource while continuing to advance the project studies towards development.

Sunstone has an ongoing strategic process to determine a preferred long-term funding model to unlock the substantial value of its two world-class projects. The Company also continues to monitor and evaluate potential opportunities to continue to grow our business in Ecuador, where clear shareholder value can be demonstrated.

ASX ANNOUNCEMENT

Track Record

The team at Sunstone has been involved in significant discoveries of porphyry and epithermal copper-gold mineralisation at Tujuh Bukit in Indonesia and Cascabel in Ecuador, and the successful development of the King of the Hills Gold Mine in Western Australia and Koniambo Nickel Mine and Smelter in New Caledonia.

Excellent infrastructure

All projects are supported by established infrastructure close to power, road and port infrastructure.

Community support

The Board and Management Team take their responsibilities towards the host communities seriously and have endeavoured to uphold the highest ESG standards across our business. Sunstone published its inaugural Sustainability Report in 2023, outlining the level of support and engagement with local communities and project stakeholders.

<sup>1</sup> Refer ASX Announcement on 24 November 2025.

<sup>2</sup> The gold equivalent (AuEq) calculation formula for porphyry gold-copper-silver mineralisation at Bramaderos is  $AuEq (g/t) = ((Au \text{ grade} \times Au \text{ price} \times Au \text{ recov} / 31.1035) + (Ag \text{ grade} \times Ag \text{ price} \times Ag \text{ recov} / 31.1035) + (Cu \text{ grade} \times Cu \text{ price} \times Cu \text{ recov} / 100)) / (Au \text{ price} \times Au \text{ recov} / 31.1035)$ . The prices applied were US\$1,800/oz gold, US\$4.50/lb copper and US\$22/oz silver. Recoveries are estimated at 88% for gold, 85% for copper and 60% for silver based on metallurgical studies. In Sunstone's opinion, all the elements included in the metal equivalents calculation have reasonable potential to be recovered and sold.

<sup>3</sup> Refer ASX Announcement on 5 February 2024.

<sup>4</sup> The gold equivalent calculation formula for the Limon epithermal gold-silver mineralisation is  $AuEq(g/t) = Au(ppm) + (Ag (ppm)/82)$ . The prices used were US\$1,800/oz gold and US\$22/oz silver. Recoveries are estimated at over 90% for gold and 90% for silver from metallurgical studies. In Sunstone's opinion all the elements included in the metal equivalents calculation have reasonable potential to be recovered and sold.

<sup>5</sup> Refer ASX Announcement on 22 October 2024.

<sup>6</sup> The AuEq calculation formula for porphyry gold-copper-silver mineralisation at El Palmar is  $AuEq (g/t) = ((Au \text{ grade} \times Au \text{ price} \times Au \text{ recov} / 31.1035) + (Ag \text{ grade} \times Ag \text{ price} \times Ag \text{ recov} / 31.1035) + (Cu \text{ grade} \times Cu \text{ price} \times Cu \text{ recov} / 100)) / (Au \text{ price} \times Au \text{ recov} / 31.1035)$ . The prices applied were US\$1,800/oz gold, US\$4.50/lb copper and US\$22/oz silver. Recoveries are estimated at 90% for gold, 78% for copper (excluded for oxide material), and 60% for silver based on metallurgical studies. Grades for the Exploration Target are 0.30g/t Au and 0.10% Cu. In Sunstone's opinion, all the elements included in the metal equivalents calculation have reasonable potential to be recovered and sold.

For personal use only

## ASX ANNOUNCEMENT

### Competent Persons Statement

The information in this report that relates to exploration results and Exploration Targets is based upon information reviewed by Dr Bruce Rohrlach who is a Member of the Australasian Institute of Mining and Metallurgy. Dr Rohrlach is a full-time employee of Sunstone Metals Ltd and has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Dr Rohrlach consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The information relating to the Bramaderos Mineral Resource is extracted from the ASX announcement on 24 November 2025. The information relating to the El Palmar Mineral Resource is extracted from the ASX announcement on 22 October 2024. The company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements and that all material assumptions and technical parameters underpinning the estimates in the relevant market announcements continue to apply and have not materially changed. The company confirms that the form and context in which the Competent Person's findings are presented for their respective Mineral Resource estimates have not been materially modified from the original market announcements.

### Information on Exploration Targets

The potential quantity and grade of the Exploration Targets is conceptual in nature. There has been insufficient exploration to estimate a Mineral Resource for the reported exploration target areas. It is uncertain if further exploration will result in the estimation of a Mineral Resource.

#### Bramaderos

The Bramaderos porphyry Exploration Target within the Bramaderos concession is estimated from four areas – the extensions to the Brama-Alba system that are not captured in the Mineral Resource estimate (MRE), the majority of the Melonal system that is not captured in the Mineral Resource estimate (MRE), and mineralisation drilled at the targets of Limon and Copete-Porotillo porphyry mineralisation.

The Exploration Target does not include known porphyry mineralisation at Sandia, Playas or Yeso. It was decided to not include these areas because Sunstone has not yet completed any or sufficient drilling in these areas. Further work in these areas will be undertaken and they are expected to contribute to an expanded Exploration Target in future.

Several areas of mineralisation have been identified outside of the area of the MRE. The MRE captured material that was drilled to sufficient density an economically modelled pit. Inadequate drilling exists in some areas both within and outside the modelled pit to show mineralisation continuity. Furthermore, the effect of the reasonable prospects of eventual economic extraction was to exclude 31% of material. This material has been captured in the Exploration Target.

Six domains were identified as having clear potential for additional mineralisation and these were reviewed either on a depth slice basis, or a block basis. Volumes were calculated and grade was assigned based on nearby data and on comparison with the overall Brama-Alba grade. This exploration target was reduced by the amount of material within it that was converted to resource by the latest MRE update.

The Melonal target is a continuation of the Brama-Alba system. It is geologically grouped with Brama-Alba. Recent drilling by Sunstone, and historical drilling from 2007, has confirmed that the Melonal target is mineralised, and that mineralisation is hosted in rocks the same as those drilled at the nearby Brama-Alba deposit. The mineralised rocks are coincident with a discrete sub-vertical magnetic anomaly measuring up to 400m in diameter, and with a vertical extent of over 1,000m. The Exploration Target for Melonal was considered to a depth of 500m. The Melonal target straddles the approved Bramaderos-01 and Bramaderos-02 concessions. This exploration target was reduced by the amount of material within it that was converted to resource by the latest MRE update.

## ASX ANNOUNCEMENT

Sunstone has drilled 8 effective diamond holes at the Limon porphyry target. Mineralisation has been intersected in a number of holes. A trench (LM\_TR\_01) was completed at Limon prior to drilling in an area of outcropping stockwork veining and minor secondary copper mineralisation. It returned 97m at 0.73g/t gold and 0.23% copper. A recent hole drilled under the trench has intersected similar stockwork veined intrusive and contains chalcopyrite.

This area around Trench TR\_LM\_01 has been included in the porphyry Exploration Target where more drilling is required to allow inclusion in a Mineral Resource estimate. This target area will be further explored with drilling programs to be executed over the next two years, subject to the Company's funding ability.

### **Copete and Porotillo**

The Copete and Porotillo exploration targets are areas of outcropping porphyry stockwork veining that occur within an extensive gold and copper soil geochemical anomaly. At Copete, there are two historical holes drilled by Ecuator (147m) and Ecuador Gold S.A. (433m). In addition, there is widespread rockchip sampling of surface mineralisation, channel sampling in ravines and an extensive mineralised trench ML-01 at Copete that assayed 214m @ 0.50 g/t AuEq<sup>2</sup> (ASX announcement 12 November 2024).

At Porotillo, within the main body of the gold-in-soil geochemical anomaly, an extensive early-mineral quartz diorite intrusion hosts overprinting porphyry-related, disseminated and vein stockwork mineralisation over an area spanning up to approximately 530m by 310m. 11 historical holes have been drilled, two by Ecuator (for 731m) in December 1999 to April 2000, and nine by Ecuador Gold S.A. (for 3,478m), in June 2007 to August 2007. Very substantial historic drill intersections were encountered from some of these holes at Porotillo.

Two domains were modelled to generate the Copete-Porotillo exploration target to depths of 200m and 400m below surface.

This target area will be further explored with drilling programs to be executed over the next two years to establish JORC-compliant data sets for future resource estimates, subject to the Company's funding ability.

### **Limon epithermal**

The Limon epithermal Exploration Target was estimated on target prospects where there was a combination of diamond drilling (by Sunstone), geological mapping, trenching, geochemistry (soils) and to a lesser extent geophysical data (magnetics) which could support the geological and mineralisation concept model.

The Limon alteration area has been covered with soil sampling on a 50m x 50m grid. This survey is an important exploration method which identified several gold-in soil anomalies that are primary targets for drilling. The soil geochemical data is further interpreted using related element associations typical of epithermal systems, such as areas of somewhat coincident gold, silver, zinc, lead, copper, tellurium and arsenic. Target areas have also been strengthened using alteration mineralogy from a hand-held Terraspec instrument. These data assist in mapping the alteration zones most likely to be associated with epithermal mineralisation.

Drilling at Limon has also intersected an intermediate sulphidation epithermal system in numerous drill holes including LMDD017, 26, 30, 32, 38, 40, 43 and 46-51. Drill intersections include 185m @ 2.85 g/t AuEq<sup>4</sup> (include 31m @ 12.93 g/t AuEq<sup>4</sup>) in LMDD026, and 269m @ 1.05 g/t AuEq<sup>4</sup> (include 11m @ 14.15 g/t Au) in LMDD040.

Standard geological mapping and rock chip sampling has also been undertaken across the Limon target area.

The volume ranges for the initial Exploration Target in the Central Shoot were estimated using cross sections and 3-D modelling in Leapfrog software, based on drilling, mineralised rock types, grade distribution, potential for extrapolating mineralisation continuity, and interpreted geological risk.

The volume ranges for the other components were estimated from geological interpretation and guided by the extent of surface geochemical anomalism, supplemented by preliminary drilling. A conservative approach was taken to the potential distribution of gold and silver-bearing veins.

This target area will be further explored with drilling programs to be executed over the next year, subject to the Company's funding ability.

## ASX ANNOUNCEMENT

### El Palmar

The Exploration Target within the El Palmar concession is estimated from within the T1, T2 and T3 areas.

The Exploration Target does not include interpreted or known porphyry mineralisation at the T4 and T5 target areas. It was decided not to include these areas because Sunstone has not yet completed any drilling at T4 and has conducted only minor drilling at T5. Further work in these areas will be undertaken and they are expected to contribute to an expanded Exploration Target in future.

The components of the exploration target are based on a combination of diamond drilling conducted by Codelco (during 2012) and by Sunstone (during 2022 and 2023), ground magnetics, multi-element soil sampling, multi-element rock chip and channel sampling, multi-element trench sampling and deep magnetic inversion anomalies modelled from ground magnetic data.

Wireframes of domains within the Exploration Target areas were created in Leapfrog software using data interpreted from the Mineral Resource block model, iso-surface contours of modelled magnetic intensities, and grade ranges in available diamond drill holes. The volumes were multiplied by a specific gravity of 2.72g/cc (the average density of the T1 resource) to determine the tonnage range of the target. Grade ranges were determined with reference to drill intersections and surface rock chip assays.

The next step in testing these targets is primarily diamond drill testing. The targets have been adequately defined, but drill programs still require further detailed planning regarding the number of drill holes, their azimuths, dips, and final depths. Drilling of these targets will be undertaken over the next two years, subject to the company's funding availability.

ASX ANNOUNCEMENT

TABLE 1 – Section 1: Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
<b>Sampling techniques</b>	<ul style="list-style-type: none"> <li>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as downhole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</li> </ul>	<ul style="list-style-type: none"> <li>The new results announced here are from diamond drilling samples. The drill core sampling was carried out using half core, generally at 1-2m intervals.</li> </ul>
	<ul style="list-style-type: none"> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> </ul>	<ul style="list-style-type: none"> <li>Core recovery was good, and core aligned prior to splitting.</li> </ul>
	<ul style="list-style-type: none"> <li>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done, this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<ul style="list-style-type: none"> <li>Diamond drill, rock chip and channel sampling points have been guided by geological mapping. The drill samples from Copete were dried, crushed to 70% passing 2mm, Split 1000g, and pulverised to 85% passing 75 microns. A 20g portion of this sample was used for multi-element analysis (IMS-230) and a 30g sample for Fire Assay Au (FAS-111).</li> </ul>
<b>Drilling techniques</b>	<ul style="list-style-type: none"> <li>Drill type (e.g., core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</li> </ul>	<ul style="list-style-type: none"> <li>Current drilling by Sunstone is diamond core drilling, similar to prior drilling at the Bramaderos project. It comprises diamond core drilling and has drilled to various depths up to 1200m. The diamond core was drilled, delivering either HTW (70.9mm) or NTW (56mm) core. Drill core is oriented using a Reflex ACT II tool for bottom of hole.</li> </ul>
<b>Drill sample recovery</b>	<ul style="list-style-type: none"> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> </ul>	<ul style="list-style-type: none"> <li>Diamond core recovery data for Copete drilling was measured for each drill run and captured in a digital logging software package. The data has been reviewed and core recovery was approximately 100% throughout.</li> </ul>
	<ul style="list-style-type: none"> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> </ul>	<ul style="list-style-type: none"> <li>Core recovery at Copete was good; no extra measures were taken to maximise sample recovery.</li> </ul>
	<ul style="list-style-type: none"> <li>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	<ul style="list-style-type: none"> <li>No relationship between sample recovery and grade has been established.</li> </ul>
<b>Logging</b>	<ul style="list-style-type: none"> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> </ul>	<ul style="list-style-type: none"> <li>Drill samples, trench samples and rock chips were logged for lithology, weathering, structure, mineralogy, mineralisation, colour, and other features. Logging and sampling were carried out according to Sunstone's internal protocols and QAQC procedures which comply with industry standards.</li> </ul>
	<ul style="list-style-type: none"> <li>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.</li> </ul>	<ul style="list-style-type: none"> <li>Drill samples, trench samples, channel samples and rock chips are logged for lithology, weathering, structure, mineralogy, mineralisation, colour, and other features.</li> </ul>
	<ul style="list-style-type: none"> <li>The total length and percentage of the relevant intersections logged.</li> </ul>	<ul style="list-style-type: none"> <li>The drill holes, plus trench and channel samples, are logged in full, from start to finish of the excavation.</li> </ul>
<b>Sub-sampling techniques and sample preparation</b>	<ul style="list-style-type: none"> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> </ul>	<ul style="list-style-type: none"> <li>Half core was used to provide the samples that were submitted for assay. Quarter core samples were taken ~1 in every 28 samples for duplicate sampling. The remaining core is left in the core trays.</li> </ul>
	<ul style="list-style-type: none"> <li>If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.</li> </ul>	<ul style="list-style-type: none"> <li>N/A.</li> </ul>
	<ul style="list-style-type: none"> <li>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> </ul>	<ul style="list-style-type: none"> <li>Surface and drill core samples from Copete were sent to the LAC y Asociados Cia. Ltda. Sample Preparation</li> </ul>

ASX ANNOUNCEMENT

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> <li>• <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i></li> <li>• <i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i></li> <li>• <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i></li> </ul>	<p>Facility in Cuenca, Ecuador. The standard sample preparation for drill core, trench, and channel samples (Code PRP-910) is: drying the sample, crushing to a size fraction of 70% &lt;2mm, and splitting the sample to a 250g portion using a riffle or Boyd rotary splitter. The 250g sample is then pulverised to &gt;85% passing 75 microns and then split into two 50g pulp samples. Then one of the pulp samples was sent to the MS Analytical Laboratory in Vancouver (Unit 1, 20120 102nd Avenue, Langley, BC V1M 4B4, Canada) for gold and base metal analysis.</p> <ul style="list-style-type: none"> <li>• The sample preparation is carried out according to industry standard practices using highly appropriate sample preparation techniques.</li> <li>• Sunstone used an industry standard QAQC programme involving Certified Reference Materials “standards” and blank samples, which were introduced in the assay batches.</li> <li>• Standards (Certified Reference Materials) or analytical blanks were submitted at a rate of 1 in 28 samples. Field duplicates were also taken at a rate of approximately 1 in 28 samples.</li> <li>• The check or duplicate assay results are reported along with the sample assay values in the final analysis report.</li> <li>• For diamond core, the routine sample procedure is to always take the half/quarter core to the right of the orientation line (looking down hole) or the cut line (in cases where the orientation line was not reliable).</li> <li>• Once assay results are received, the results from duplicate samples are compared with the corresponding routine sample to ascertain whether the sampling is representative.</li> <li>• Sample sizes are considered to be appropriate for the style of sampling undertaken and the grain size of the material, and correctly represent the style and type of mineralisation at the exploration stage.</li> </ul>
<p><b>Quality of assay data and laboratory tests</b></p>	<ul style="list-style-type: none"> <li>• <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i></li> <li>• <i>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis, including instrument make and model, reading times, calibration factors applied and their derivation, etc.</i></li> <li>• <i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i></li> </ul>	<ul style="list-style-type: none"> <li>• Sunstone uses a fire assay gold technique for Au assays (FAS-111) and a four acid multi-element technique (IMS-230) for a suite of 48 elements. FAS-111 involves Au by Fire Assay on a 30-gram aliquot, fusion and atomic absorption spectroscopy (AAS) at trace levels. IMS-20 is considered a near total 4 acid technique using a 20g aliquot followed by multi-element analysis by ICP-AES/MS at ultra-trace levels.</li> <li>• This analysis technique is considered suitable for this style of mineralisation.</li> <li>• Handheld XRF data, together with detailed geological logging, are used as a guide to areas of potential mineralisation in drillholes and samples from these areas are sent for laboratory analysis as described above.</li> <li>• Standards, blanks and duplicates are inserted ~1/28 samples. The values of the standards range from low to high grades and are considered appropriate for monitoring performance near the cut-off and near the deposit's mean grade.</li> <li>• The check sampling results are monitored, and performance issues are communicated to the laboratory if necessary.</li> </ul>
