

North Kalgoorlie Hub, WA – Drilling Update

Further high-grade growth at Sovereign as new shallow gold discovery emerges at Lady Margaret

- Ongoing growth drilling at the Comet Vale Gold Project in WA (part of Gorilla Gold's 1.2Moz @ 3.7g/t Au North Kalgoorlie Hub) continues to deliver outstanding results at the cornerstone Sovereign Deposit:
 - **7.6m @ 5.1g/t Au from 251.3m** in STEX189
 - **1.2m @ 31.5g/t Au from 69.1m** in STEX192
 - **2.8m @ 7.8g/t Au from 190.8m** in STEX187
 - **2.0m @ 9.6g/t Au from 40.2m** in STEX172
 - **2.0m @ 6.3g/t Au from 110.1m** in STEX181
 - **0.5m @ 19.8g/t Au from 151.1m** in STEX188
- Drilling continues to extend multiple high-grade lodes within and adjacent to the current Sovereign Mineral Resource (410,000oz at 4.3g/t Au).
- Initial scout drilling at the newly identified Lady Margaret Prospect 1km west of Sovereign has intersected significant shallow gold mineralisation:
 - **2.0m @ 5.9g/t Au from 18.0m** in LMEX010
- Drilling continues across the North Kalgoorlie Hub targeting resource growth at Sovereign and following up recent discoveries at Donkey Kong, Diddy Kong and Magilla.
- Drilling is also underway at the Vivien Project, with one drill rig targeting new high-grade discoveries.

Gorilla Gold Mines Ltd ('Gorilla', 'GG8' or 'the Company'), is pleased to report further significant drilling results from its 100%-owned Comet Vale Gold Project, located 100km north of Kalgoorlie in WA. The Comet Vale Project forms part of Gorilla's North Kalgoorlie Hub, which hosts current Mineral Resources of 1.2Moz @ 3.7g/t Au and is expanding rapidly with ongoing drilling.

Gorilla Chief Executive Officer, Charles Hughes, commented:

“These latest results continue to highlight the significant growth potential of the Comet Vale Gold Project as our 2026 exploration campaign advances and results begin to flow from multiple drill programs across the North Kalgoorlie Hub.

“At Sovereign, drilling is successfully extending high-grade mineralisation well beyond the current resource footprint and improving our understanding of the broader mineralised system.

“Sovereign remains one of the cornerstone deposits within Comet Vale, hosting a high-grade resource of 410,000 ounces at 4.3g/t over a strike length of approximately 1.3 kilometres. Importantly, drilling continues to identify multiple parallel lodes associated with the contact between two major lithological units, reinforcing our view that there is considerable scope for further growth both along strike and at depth – as evidenced by these latest results.

“Meanwhile, our exploration team continues to kick some impressive goals with initial scout drilling at the new Lady Margaret prospect delivering a 2m intercept grading 5.9g/t Au in a shallow position that remains wide open. Lady Margaret was historically the highest grade producer in the area in the late 19th/early 20th Century. This provides yet more evidence of the significant endowment of the Comet Vale Project – opening up yet another new potential discovery alongside the already well-established deposits at Sovereign and Lakeview.

“With drilling underway at the North Kalgoorlie Hub and at Vivien, we are executing one of the largest exploration programs in the Company’s history, and we are confident that the results we generate will underpin the next significant uplift in the Company’s resource inventory as we gear up to deliver more resource updates later this year.”

Figure 2. Location of GG8 Projects in WA

Growth and Exploration activities at The North Kalgoorlie Hub

The North Kalgoorlie Hub has a resource base of 1,200,000oz @ 3.7g/t Au and is historically under-explored, with more than 60km of high priority drill targets. The Hub comprises the Comet Vale and Mulwarrie Projects, both on granted Mining Licences and close to milling and transport infrastructure.

Gorilla Gold added >1,000,000oz to the North Kalgoorlie Hub's resource base in 2025 by progressively drilling its pipeline of exploration targets.

Gorilla has an aggressive strategy to **Discover** further gold resources, **Define** these resources and **Develop** the project.

The Comet Vale Project has a Mineral Resource Estimate of 0.86Moz @ 3.7g/t Au and has delivered historical gold production of >200koz @ >20g/t Au, with underground mining operations occurring as recently as 2020.

The Comet Vale Project lies within granted Mining Leases, adjacent to the Goldfields Highway, in a region with multiple operational gold mills within a 100km radius. The Company has identified a 10km by 3km zone of interrelated structural deformation and mineralisation zones, within which the Sovereign shear-zone, King Kong shear-zone, and the Silverback shear-zones are situated.

Figure 3. Location of Kalgoorlie North Hub, showing Mulwarrie and Comet Vale Projects.

Growth drilling at the Sovereign deposit continues to intersect high grade mineralisation

Ongoing drilling targeting Mineral Resource growth at the Sovereign deposit continues to intercept high grade gold mineralisation.

Mineralisation at Sovereign is hosted within quartz veins associated with pyrrhotite-chalcopyrite-sphalerite-galena sulphide development, often with visible gold.

Mineralised zones form within shear zones at the margins of lithological contacts, adjacent to a major stratigraphy change from mafic to ultramafic lithologies.

Table 1. New Comet Vale assays, this release

Figure 4. Photo of STEX192 from Sovereign North intercept, 1.2m @ 31.5 g/t Au from 69.1m

Scout discovery drilling at Lady Margaret Prospect intersects shallow gold mineralisation

Broad spaced RC drilling targeting gold in soil anomalism and historical gold workings has been undertaken at the Lady Margaret prospect, 1km west of the Sovereign deposit.

The Lady Margaret Prospect was the very first discovery in the Comet Vale area in the late 1890's, with gold mineralisation associated with mafic rocks, porphyry intrusives and pyrite mineralisation.

Numerous drill holes are currently with the labs from the Lady Margaret prospect.

Figure 5. Comet Vale targets and resource areas 2026

Next Steps at North Kalgoorlie Hub

Four drill rigs are active at **Comet Vale** undertaking Discovery and Definition drilling. Two RC rigs are following up recent discoveries at Diddy Kong, Donkey Kong and Magilla as well as high grade footwall lodes and southern extents to mineralisation at Sovereign which are also being tested by diamond drilling.

Results from this drilling are expected on an ongoing basis, with the turnaround time from assay labs currently slower than usual due to higher demand for laboratories within the industry.

Other Definition work, including engineering, geotechnical, metallurgical and hydrological studies, is ongoing, alongside Development work which at this stage is focused on project permitting.

This announcement has been authorised and approved for release by the Board.

Competent Person's Statement:

The information in this announcement relates to exploration results for the Comet Vale Project which Mr. Charles Hughes has reviewed and approves. Mr. Hughes, who is an employee of Gorilla Gold Mines Ltd, a professional geoscientist and a Member of the Australian Institute of Geoscientists. Mr. Hughes has sufficient experience relevant to the style of mineralisation and type of deposits under consideration, and to the activities which have been undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves. Mr. Hughes consents to the inclusion in this announcement of the matters based on this information in the form and context in which it appears.

Specific exploration results referred to in this announcement were originally reported in the following Company announcements in accordance with ASX Listing Rule 5.7:

Title	Date
High Grade Zone at Sovereign Grows	29 May 2026
Fourth Gold Discovery in Three Weeks at Comet Vale	11 May 2026
High-Grade Discovery at Sovereign	4 May 2026

APPENDIX 2 JORC TABLES

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Comments
Sampling techniques	- Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. - Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. - Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). - In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.	- RC drilling - samples collected as 4m composites and in areas where interesting lithology, alteration, mineralisation or veining was encountered, 1m splits were taken. Composite samples are collected from samples piles, 1m splits are taken for every metre from the cyclone with duplicate samples taken at the instruction of the field geologist from the second chut on the cone. DD drilling has samples collected as half core in intervals between 0.3-1m based on lithology. - Samples collected by GG8 field crew and submitted to ALS Laboratory in Kalgoorlie, WA. All samples are considered to be representative for the manner in which they are used. - The samples were analysed using the photon assay method which uses a 0.5kg sample and requires minimal handling. The samples are riffle split at the lab and crushed to 80% passing 2mm to ensure homogeneity as uniform sample distribution is important to a quality analysis. SOILS - Soil samples were collected by Gorilla Gold and contractors (OZEX Exploration Services and Omni GeoX) personnel on a 400x200m across Mulwarrie (Mulline) and 200x40m, 200x20m and 100x20m grid across Comet Vale. - Samples were collected by digging a 30x30x10cm pit, homogenising and then sieving and collection of a dry 250g -2mm sample. - Samples were submitted to LabWest (Perth) for Ultra Fine Fraction (UFF) separation (<2µm) and analysis by Aqua Regia ICP-MS and ICP-OES for determination of Au and 51 elements.
Drilling techniques	Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	RC drilling was completed by several contractors using multiple modern RC rigs capable of significant drill depths. RC drilling uses a standard 5.5in bit and an auxiliary booster capable of 900psi, sufficient to keep sample dry at most depths. DD drilling was completed by contractors using multiple modern DD rigs. All drill rigs utilised by GG8 are industry best standard.
Drill sample recovery	Method of recording and assessing core and chip sample recoveries and results assessed.	RC sample recovery was qualitatively assessed by the field geologists. Good recoveries were had. DD recovery measured actual core length between drillers blocks to the nearest cm. Sample weights are recorded by the laboratory and average 3kg.
	Measures taken to maximise sample recovery and ensure representative nature of the samples	Sample depths were cross-checked regularly. The cyclone was regularly cleaned to ensure no material build up and sample material was checked for any potential downhole contamination. The drilling sample recoveries/quality are acceptable and are appropriately representative for the style of mineralisation.

	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	No obvious sample recovery biases or biases related to loss or gain of fines have been identified.
Logging	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.	- Logged for geology on the 1m intervals with chips washed and stored in chip trays by the geologist. Logging was inputted directly into the onsite laptops using suitable Company logging. - DD core stored in trays with every metre logged. - Logging is of a qualitative nature.
	Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.	RC chips and DD were logged for lithology, colour, weathering, texture and minerals present. Structural measurements and geotechnical data were recorded on DD core
	The total length and percentage of the relevant intersections logged.	N/A
Sub-sampling techniques and sample preparation	If core, whether cut or sawn and whether quarter, half or all cores taken.	Core is sawn with half cores taken for assay
	If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.	- RC drilling single 1 metre splits were automatically taken at the time of drilling by a cone splitter attached to the cyclone. 4m composite samples were taken from sample piles. Samples have been dry. Samples are then riffle split at the lab into 0.5kg samples and crushed to 2mm prior to photon assay with a particle size distribution test to ensure 80% passing the 2mm threshold. SOILS - Soil samples were submitted to LabWest in Perth where the -2µm particle size fraction is extracted using the Ultra Fine method developed by CSIRO and LabWest.
	For all sample types, the nature, quality and appropriateness of the sample preparation technique.	- The technique was appropriate for the work undertaken. During RC logging samples that showed mineralisation, veining or alteration had 1m split samples collected. 1m split samples are later taken from where 4m composites show >0.2g/t gold anomalism. During DD logging any sulphide veining or alteration were sampled. SOILS - The Ultra Fine Fraction sampling and analysis has been proven to be an effective technique for gold exploration across a wide range of regolith types.
	Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.	- QAQC reference samples and duplicates were submitted by GG8. In house standards and blanks were also inserted by ALS. SOILS - Sub-sampling is conducted by LabWest using their proprietary UFF method.
	Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.	1m samples are automatically bagged from the cyclone, field duplicates are taken from a second chute off the splitter. DD duplicates are taken by sampling quarter core over the same interval as the primary sample. SOILS - Every 50 samples a field duplicate is collected by digging a second pit within 2-3m of the original sample pit, homogenising and then sieving and collection of a dry 250g -2mm sample.
	Whether sample sizes are appropriate to the grain size of the material being sampled.	All RC samples are collected to approximately 1-5 kg. The sample sizes taken are appropriate relative to the style of mineralisation and analytical methods undertaken. DD sample size is appropriate. SOILS

Quality of assay data and laboratory tests	The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.	Sample sizes are appropriate for the grain size of the material sampled.
	For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	- All samples were sent to ALS laboratory in Kalgoorlie. Photon Assay method has shown to provide quick turnaround times and high accuracy. SOILS - Samples were screened in the field to -2mm. LabWest then takes a sub-sample of <2µm material for analysis. - The UFF sample preparation was defined following a Research and Development project conducted under the direction of CSIRO. - Field duplicates are submitted and perform to internal GG8 standards.
	Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.	- Certified Reference Materials (CRMs) are included in each batch to ensure the reliability of the assay. These CRMs, such as OREAS254C, OREAS230, and OREAS241, are specifically chosen for photon assay to maintain quality standards and were evaluated against published certificates. The standard deviation was minimal for samples. Selected photon assays over a range of grades and from different parts of orebodies are umpire checked with Fire Assays and so far shows no material difference in reported grades. SOILS - Field duplicates at a frequency of 1:50 are submitted and performed to GG8 internal standards.
	The verification of significant intersections by either independent or alternative company personnel.	- External verification has not been carried out, but values were checked against logging and photographs to ensure the intersected Au values are in line with logged alteration, mineralisation or veining. Significant intercepts have been verified by the Exploration Manager, the CEO and Principal consulting geologist. SOILS - Significant results are revisited with ground-truthing and follow-up sampling where appropriate.
Verification of sampling and assaying	The use of twinned holes	No twinned holes at this stage as the project is still advancing.
	Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	- Data was captured directly into specific geological logging software. Assay files have been sent directly from the lab to database manager to avoid operator errors. All physical sampling sheets are filed and scanned electronically and submissions to the lab checked to ensure that no samples are missing or incorrect IDs. SOILS - Sample locations and track files are stored directly onto the sampler's GPS and downloaded for verification. Assay files have been sent directly from the lab to database manager to avoid operator errors. All physical sampling sheets are filed and scanned electronically and submissions to the lab checked to ensure that no samples are missing or incorrect IDs.
	Discuss any adjustment to assay data.	No adjustments were made to the assay data because none are needed.

Location of data points	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	Samples were located using handheld Garmin GPS, the GPS is accurate within 3-5m.
	Specification of the grid system used.	All locations and maps quoted in this Report are using the GDA1994 MGA, Zone 51 coordinate system.
	Quality and adequacy of topographic control.	Topography based on detailed topographic surveys.
Data spacing and distribution	Data spacing for reporting of Exploration Results.	- Data spacing is varied SOILS - Data spacing is varied with sampling at 400x200m across Mulwarrie (Mulline) and 200x40m, 200x20m and 100x20m grid across Comet Vale.
	Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.	Data spacing is sufficient for the Mineral Resources estimate, no Reserves have been estimated yet.
	Whether sample compositing has been applied.	Intercepts are aggregated based upon 0.5g/t Au cut-off grade and 4m of dilution material.
Orientation of data in relation to geological structure	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.	- The relationship between the drilling orientation and the orientation of mineralised structures is not considered to have introduced a sampling bias. Most holes have been drilled perpendicular to the main orientation of the interpreted mineralised zone. SOILS - Soil lines have been oriented perpendicular to interpreted structures and lithological contacts as appropriate in orogenic gold exploration.
	If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	No drilling orientation related sampling bias has been identified at the Project. Some orientation changes were made to historic holes, and the main structure was intersected at the interpreted depth.
Sample security	The measures taken to ensure sample security.	- Samples were transported from the field to the lab by GG8 personnel or GG8's freight contractor. SOILS - Samples were transported from the field to LabWest by GG8's freight contractor.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	GG8 undertakes continuous audits and reviews of all its field processes and results.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.	Gorilla Gold Mines Ltd 100% owns the projects through its wholly owned subsidiaries. COMET VALE M29/35, M29/52, M29/85, M29/185, M29/186, M29/197, M29/198, M29/199, M29/200, M29/201, M29/232, M29/233, M29/235, M29/270, M29/321 Kakara Part A has been granted Native Title over the project area. The Company does not at present have any agreements with Kakara part A but are in the process of engagement. MULWARRIE M30/119, M30/145, E30/511, E30/512, E30/513, P30/1141, P30/1142, P30/1143. Marlinyu Ghoorlie has a Native Title claim over the project area. The Company has an existing agreement over the majority of the project area and is currently negotiating the inclusion of the additional tenements with Marlinyu Ghoorlie.
	The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	No known impediments exist with respect to the exploration or development of the tenements.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	See previous announcements. In particular ASX announcement, 13 September 2024, Review of Historical Vivien and Comet Vale Databases and the Bardoc/Spitfire ASX announcement 19 March 2019, High-grade diamond drilling results at Mulwarrie confirm lode structures and pave way for resource upgrade.
Geology	Deposit type, geological setting and style of mineralisation.	COMET VALE & MULWARRIE Archean orogenic gold mineralisation associated with major structures and mafic-ultramafic stratigraphy with intermediate intrusives adjacent to intracratonic monzogranites, gold mineralisation is associated with quartz veining, pyrrhotite, chalcopyrite, galena, sphalerite, and amphibole-biotite-chlorite alteration.

Drill hole Information	- A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: - easting and northing of the drill hole collar - elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar - dip and azimuth of the hole - down hole length and interception depth - hole length.	Tables reported in the announcement.
	If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	No information material to the understanding of the exploration results has been excluded.
Data aggregation methods	In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.	- Assay results reported here have been length weighted. - No metal equivalent calculations were applied. - Cut off grades is 0.5g/t Au
	Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.	- All samples were 1m or 4m samples were reported as returned. - Compositing is based on a maximum of 4m internal dilution with a minimum cut off of 0.5g/t Au.
	The assumptions used for any reporting of metal equivalent values should be clearly stated.	No weighting used.
Relationship between mineralisation widths and intercept lengths	These relationships are particularly important in the reporting of Exploration Results.	All samples reported are downhole width.
	If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.	Mineralization is generally perpendicular to drilling orientation.
	If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').	All intercepts are down hole lengths, true widths not yet determined.

Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Plans and sections are located in the body of the announcement.
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	- All samples were reported for Au and their context discussed. SOILS - The accompanying document is a balanced report with a suitable cautionary note. - Statistics for UFF soil samples (Au) within the Comet Vale project to date (n: 2,377) are: Minimum: 0.8 ppb Maximum: 24,049 ppb Median: 22 ppb Mean: 77 ppb S.D: 687 ppb 90%: 89 ppb 95%: 152 ppb 98%: 329 ppb - Statistics for UFF soil samples (Au) within the Mulwarrie-Mulline project to date (n: 1,677) are: Minimum: <0.5 ppb Maximum: 5070.6 ppb Median: 5.8 ppb Mean: 11 ppb S.D: 124 ppb 90%: 14.8 ppb 95%: 21.8 ppb 98%: 32.3 ppb - Excluding outlier max value of 5070.6 ppb (n: 1,676): Minimum: <0.5 ppb Maximum: 160.2 ppb Median: 5.8 ppb Mean: 8 ppb S.D: 9.7 ppb 90%: 14.8 ppb 95%: 21.7 ppb 98%: 32.3 ppb
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	All other relevant data has been included within this report.

For personal use only

Further work	The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).	COMET VALE Additional soil sampling across the Comet Vale project is planned. Drilling is ongoing, refer to end of text for more comprehensive update. MULWARRIE Additional soil sampling across the Mulwarrie project is planned and drilling is scheduled to recommence in Q4 2025.
	Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	Supporting diagrams are all found in the body of the text.
