

Diamond Drilling Extends and Defines Broad Near-Surface Silver Zone at Elizabeth Hill

Highlights

- **Diamond drilling intersects 67.1m @ 19 g/t Ag from surface** (26WCDD036) in a broad near-surface silver zone extending west of the current Elizabeth Hill Mineral Resource Estimate (MRE) block model¹, including internal higher-grade zones of –
 - **12.3m @ 22 g/t Ag from 24.7m down hole;** and
 - **10.9m @ 24 g/t Ag from 43.9m down hole.**
- Further significant intersections ≥ 10 g/t Ag include:
 - **48.5m @ 19 g/t Ag from 1.5m down hole** (26WCDD035), including –
 - 25.5m @ 23 g/t Ag from 16m;
 - **24m @ 14 g/t Ag from 35.5m down hole** (26WCDD033), including –
 - 2.7m @ 22 g/t Ag from 35.5m.
- Diamond holes 26WCDD031-036 have **infilled and extended the mineralised zone at Elizabeth Hill North**², confirming broad zones of low to moderate grade silver within, below, north and west of the current MRE block model.
- This near-surface zone is interpreted to sit around the known high-grade silver system, **remains open**, and has potential to add volume and contained metal to the current MRE.
- At **Elizabeth Hill Deeps**, minor silver mineralisation in 26WCDD030 constrained the northern extent of the newly identified high-grade zone³, **which remains open to the east and south.**
- Final diamond core assays (26WCDD037-39) expected by the **end of August 2026.**
- Results will feed an **updated JORC 2012 MRE in Q4 2026** and the **Elizabeth Hill Scoping Study**, also commencing Q4 2026.
- **Further step-out and infill diamond drilling planned for H2 2026** to follow up H1 successes, advance conversion of Inferred to Indicated resources, and continue defining the new high-grade zone below historical mining.

West Coast Silver Limited (ASX: WCE) ('West Coast Silver' or the 'Company') is pleased to announce the receipt of further assay results for the Elizabeth Hill North ('EHN') and Elizabeth Hill Deeps ('EH Deeps') diamond drill programs (Figure 1 and 2 and Table 1).

DIAMOND DRILL RESULTS

Elizabeth Hill North

Drill holes 26WCDD031-36 continued the infill and extension of the mineralised zone to the north and west of the Elizabeth Hill April 2026 MRE block model⁴. Completed diamond drilling added to the successful 2026 Reverse Circulation ('RC') drill program⁵ (Figures 1, 4 and 8-11).

Diamond drill holes confirm and expand the broad zone of mineralisation defined by earlier RC drilling with low to moderate grade silver mineralisation both within and west of the MRE block model. Silver mineralisation is hosted in intensely silica-altered granite and quartz-carbonate veins within the Munni Munni Fault Zone (MMFZ).

Refer Table 1 for significant intervals ≥ 10 g/t and ≥ 20 g/t Ag. All depths are down drill hole and not true widths. Select significant intersections include:

- 26WCDD036: **67.1m @ 19 g/t Ag from surface**, including numerous zones ≥ 20 g/t Ag.
- 26WCDD035: **48.5m @ 19 g/t Ag from 1.5m down hole**, with several zones ≥ 20 g/t Ag, including:
 - **25.5m @ 23 g/t Ag from 16m down hole; and**
 - **3.2m @ 20 g/t Ag from 7m down hole.**
- 26WCDD032 and 33 intersected multiple broad intervals ≥ 10 g/t Ag including numerous zones ≥ 20 g/t Ag, including:
 - **1.02m @ 21 g/t Ag from 44m down hole** (26WCDD032);
 - **2.7m @ 39 g/t Ag from 10m down hole** (26WCDD033); and
 - **5.5m @ 26 g/t Ag from 25m down hole** (26WCDD033).

The broad zone of shallow silver mineralisation, within and west of the MMFZ, has the potential to add volume to the April 2026 MRE mineralised zone. The mineralised system remains open in all directions (Figures 1, 4 and 8-11).

Significant assay results are summarised in Table 1. Full cross-section descriptions and figures are provided in Appendix 1.

26WCDD036	79	1	11				

Zones of high-grade lead typically flank high grade silver zones at the Elizabeth Hill deposit and may indicate the presence of silver mineralisation further to the north along the MMFZ. This is supported by shallow, scout aircore hole 25WCAC008 with 0.5m @ 61g/t Ag from 8m. West Coast Silver plans to complete extensive surface geophysical surveys in Q3 2026 to the north of reported drilling in this announcement towards the Maitland prospect (Figure 5) in search of anomalism that may be representative of new silver and/or base-metals occurrences along the MMFZ.

Elizabeth Hill Deeps

Diamond drill hole 26WCDD030 (Figure 1, 3, 4, 7) was drilled targeting the potential continuation of high-grade silver mineralisation intersected in historical drilling from underground to the east and below the Elizabeth Hill Mine workings (*UGD084, 7m @ 607g/t Ag from 57m; including 2m @ 1,995g/t Ag from 61m*) and 26WCDD029 (*3m @ 524g/t Ag from 183m; including 1.5m @ 1,039g/t Ag from 184.5m⁶*).

26WCDD030 intersected the granite-ultramafic contact at a shallow depth and continued within granite until the end of the hole at 275.5m depth (Figure 7). From a structural perspective, the drill hole remained within the granite footwall to the newly identified EH Deeps mineralised zone. Only minor silver mineralisation (less than 10 g/t Ag) was returned from 26WCDD030 drill core passing 8m to the east of and below the historical UGD084 intersection.

The minor silver mineralised intersection in 26WCDD030 aligns with a newly interpreted, subvertical, northwest trending fault splaying off the MMFZ. This fault splay appears to trend into the MMFZ, aligning with mine workings to the north, and is positioned east of the EH Deeps mineralised zone (Figure 1). Its presence is interpreted to have caused pronounced step-wise changes in depth along the granite-ultramafic contact in this area.

The newly identified EH Deeps mineralised zone is situated between this eastern fault splay and the MMFZ to the west. The potential role of this fault splay as a structural control on the EH Deeps mineralised zone, similar to the influence of the MMFZ to the north and west, is currently under investigation.

The EH Deeps mineralised zone comprises a **50m long north-south, sub-horizontal, silver mineralised trend at depth of 140m to 150m below surface**. This zone also includes a historical intersection of 4m @ 223g/t Ag from 190m in historical surface RC drill hole AG33⁶, as well as other anomalous drill intersections with silver in the 5-50g/t Ag range from surface and underground drilling. This mineralised trend is on the contact between granite and ultramafic rocks that sit to the east and are offset from the main MMFZ. **The EH Deeps zone is open to the east and south of the current drill intersections.**

Previous drilling in this area has targeted the vertical MMFZ, resulting in the EH Deeps mineralised zone and newly interpreted fault splay being inadequately tested. Controls on this trend are poorly constrained. Most drill holes passed over the interpreted sub-horizontal trend of the EH Deeps mineralised zone, and continued westward to intersect the MMFZ. **There is potential for additional mineralisation, within structurally controlled splays sub-parallel to the MMFZ that intersect the granite-ultramafic lithology contact to the east of the main MMFZ.**

⁶ Refer ASX Announcement "Elizabeth Hill high grade silver discovery and near surface mineralisation extension" dated 9 July 2026

Commenting on the program, Executive Director Sergei Smolonogov said:

“The latest drilling results continue to confirm that silver mineralisation at Elizabeth Hill extends beyond the historical underground mine and is associated with a broader mineralised structural corridor along the Munni Munni Fault.

When combined with earlier 2026 RC results, the footprint of lower grade mineralisation north and west of the existing MRE has been expanded and infilled but not closed out. This shows that a significant volume of lower grade mineralisation is zoned about higher grade silver, increasing the potential for additional contained silver at lower grades.

Hole 26WCDD030, although only hitting minor silver mineralisation at the northern extent of the new high-grade zone below historical workings, successfully bracketed the new zone. This is consistent with the structural model coming together to explain the occurrence of mineralisation at depth. This will assist in follow-up drill targeting to better define and expand the deeper new high grade silver zone to the east and south.

We look forward to releasing the final three holes from the H1 2026 diamond drilling program in the next few weeks and a start on the update of the current MRE as soon as possible”.

Figure 1. Plan view showing location of 2026 diamond holes drilled at Elizabeth Hill. The Plan highlights 1) an area of new, open low-grade mineralisation west of the April 2026 MRE (see Figure 2); and 2) the new EH Deeps high grade zone which is constrained in the north by hole 26WCDD030 (see Figure 3).

Figure 2. Plan view of north Elizabeth Hill showing the significant intercepts of the 2026 diamond drilling (light blue) and RC (yellow) campaigns. RC intercepts previously reported in WCE ASX Announcements dated 9 June 2026 and 9 July 2026.

Figure 3. Plan view of interpreted new Elizabeth Hill Deeps high-grade mineralisation trend south of Elizabeth Hill showing the significant intercepts of the 2026 diamond drilling campaign. Intercepts previously reported in WCE ASX Announcement dated 9 July 2026. Note drillhole 26WCDD030 passes beneath the zone, while 25WCDD023 and 025 as well as 26WCDD026 pass above the zone.

Figure 4. Long section showing 2026 diamond drilling (light blue callout) and RC drill program (yellow callout) pierce points projected onto the Munni Munni Fault. **Note:** 26WCDD027 did not target to intersect the Munni Munni Fault. RC and 26WCDD026-29 DD intercepts previously reported in WCE ASX Announcements dated 9 June 2026 and 9 July 2026.

NEXT STEPS

West Coast Silver will continue to advance the Elizabeth Hill Silver project through:

- **Ongoing drilling** to expand the scale of the Elizabeth Hill mineralised system through testing of depth extensions below holes that terminated in mineralisation, infill lower-density areas within the MRE to improve resource categorisation, and an evaluation of along-strike and near-mine extensions, including the Maitland and Elizabeth Hill South prospects.
- **Detailed geological and structural review** of all 2025-2026 drilling data, including interpretation of the change in strike and plunge of silver mineralisation, to plan and prioritise follow-up drilling at Elizabeth Hill North and South, and newly identified targets in the northwest of the project area.
- **Surface and downhole geophysical surveys** for new target generation along the MMFZ and to support further extension and development of Elizabeth Hill during 2026, including surface IP, CSAMT, EM and downhole EM methods.
- **Economic studies** based on an upgraded, and potentially larger-scale MRE, compliant with the JORC 2012 Code to support evaluation of a project development pathway to a potential restart of mining operations.
- **Regional exploration programs** designed to unlock the broader scale potential of the Elizabeth Hill Project, both along the MMFZ and potential parallel structural and geological analogues to Elizabeth Hill (**Figure 5**).

Figure 5. Elizabeth Hill regional exploration prospects plan view. West Coast Silver is advancing to test multiple exploration prospects and targets beyond Elizabeth Hill that remain under-explored.

Elizabeth Hill Silver Project

Elizabeth Hill is one of Australia's highest-grade silver projects, based on historical production grades, and having a proven production history. Key points are outlined below:

- **High grades enabled historical low ore processing tonnes.** A total of **1.2 Moz** of silver was produced from just **16,830t** of ore at a head grade of **2,194g/t** (70.5 oz/t Ag)⁷.
- **Mining operations ceased in 2000** as a result of low silver prices (US\$5/oz)⁸.
- **Simple historical processing techniques were used focussing only on native silver extraction.** Native silver was recovered via low-cost gravity separation techniques.
- **Untapped mineral resource expansion potential remains.** The Elizabeth Hill deposit remains open at depth and along strike. Recent consolidation of the WCE tenement land holding offers potential to discover more Elizabeth Hill style deposits near mine and regionally.
- **World leading silver grades located on a mining lease** with proximity to the Radio Hill processing facility (Figure 6).

Figure 6. Combined West Coast Silver (WCE), Greentech Metals (GRE) and Alien Metals (AIM Listed: UFO) Tenement Location

Through the consolidation of surrounding land packages into a single contiguous 180km² package, significant exploration and growth potential has been created near mine and regionally. The land package holds a significant portion of the Munni Munni Fault system, and other fault systems subparallel to the Munni Munni Fault system, which are considered prospective for Elizabeth Hill silver deposit analogues.

Competent Person Statement

The information in this announcement that relates to Exploration Results is based on information reviewed by Mr Tony Donaghy who is a Registered Professional Geoscientist (P.Geo #0971) with the Association of Professional Geoscientists of Ontario, a Recognised Professional Organisation. Mr Donaghy is a consultant to West Coast Silver and a full-time employee of ERM Australia Consultants Pty Ltd.

Mr Donaghy has sufficient experience that is relevant to the style of mineralisation and type of deposits under consideration, and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves', and a Specialist under the VALMIN Code 2015 Edition of the 'Australasian Code for Public Reporting of Technical Assessments and Valuations of Mineral Assets'. Mr Donaghy consents to the inclusion in the announcement of the matters based on this information and in the form and context in which it appears.

The Company makes reference to information previously announced to the ASX. The Competent Person confirms that they are not aware of any new information or data that materially affects the information included in the original market announcements, and that all material assumptions and technical parameters underpinning the estimates in those announcements continue to apply and have not materially changed.

Forward-Looking Statements

Statements in this announcement which are not statements of historical facts, are forward-looking statements. These statements instead represent management's current expectations, estimates and projections regarding future events. Although management believes the expectations reflected in such forward-looking statements are reasonable, forward-looking statements are based on the opinions, assumptions and estimates of management at the date the statements are made and are subject to a variety of risks and uncertainties and other factors that could cause actual events or results to differ materially from those projected in the forward-looking statements.

Accordingly, investors are cautioned not to place undue reliance on such statements.

Cautionary Statement

This document is neither a prospectus nor an offer to subscribe for fully paid ordinary shares. West Coast Silver and its directors, employees and consultants make no representations or warranty as to the accuracy, reliability or completeness of this document, and have no liability, including liability to any person by reason of negligence of, or contained in or derived from, or for any omissions from this document, except liability under statute that cannot be excluded. This document contains reference to certain targets and plans of West Coast Silver which may or may not be achieved. The performance of West Coast Silver may be influenced by a number of factors, uncertainties and contingencies, many of which are outside the control of the Company and its directors, staff and consultants.

Appendix 1: Cross Sections

Cross Section A – A' with Diamond Drill Hole 26WCDD030

Diamond drill hole 26WCDD030 targeted silver mineralisation at the lower contact of the ultramafic pyroxenite to the granite which was intersected in the historic underground diamond drill hole UGD084 (7m @ 607g/t Ag from 57m including 2m @ 1,995g/t Ag from 61m), (Figure 7). Drill hole 26WCDD030 was expected to intersect the prospective ultramafic/granite contact at approximately 190m but instead entered the granite at 47.24m to the end of hole at 275.5m indicating a complexly shaped intrusive ultramafic/granite contact. The drill hole intersected several structures characterised by intensely fractured and moderately to intensely silicified granite and gneiss from 57m before penetrating the Munni Munni Fault Zone with intense fracturing and silicification, brecciation and quartz-calcite veins between 232m and 254m. Although the drill hole does not contain any significant silver intersections, it had elevated silver above 5 g/t between 213m and 221m with a maximum of 9.56 g/t Ag.

Figure 7. Cross section A-A' showing diamond drill hole 26WCDD030. Note hole 26WCDD030 passing close to but not through the newly defined EH Deeps high grade silver zone along granite / ultramafic contact. Hole has successfully bracketed the mineralisation.

ASX: WCE ANNOUNCEMENT

13 August 2026

Cross Section B – B' with Diamond Drill Holes 26WCDD034

Diamond drill hole 26WCDD034 was targeted to test the Munni Munni Fault Zone beneath the previously announced MRE₁₀ (Figure 8). The drill hole intersected mostly granite and gneiss with an intermittent ultramafic unit between 34.1m and 45.9m. The drill hole fully intersected the Munni Munni Fault Zone between 88m and 101m characterised by intense silicification and a fault breccia between 89.6m and 92.7m. The Munni Munni Fault Zone contained significant Ag of 2.6m @ 14 g/t Ag from 87m and 3.3m @ 13 g/t Ag from 92.7m with core lost due to extremely broken ground between 90m and 92.7m.

Figure 8. Cross section B-B' showing diamond drill hole 26WCDD034.

Cross Section C – C' with Diamond Drill Holes 26WCDD035 and 26WCDD036

Two diamond drill holes, 26WCDD035 and 26WCDD036, were targeted to test the area west of the MRE previously reported¹⁰ (Figure 9). Both drill holes intersected granite and gneiss with minor short intervals of ultramafic rock. Drill hole 26WCDD035 intersected very broken ground from 10m to 45.9m with several intervals of completely broken and ground rock between 33.3m and 38.3m. The broken zone contains extremely silicified granite with the granite textures completely destroyed by the silicic alteration. Similar to drill hole 26WCDD035, drill hole 26WCDD036 contained extremely broken core with intensely silicified granite and gneiss between 9.5m and 66.3m. The extremely broken ground indicates that the granite and gneiss has been faulted. It is subject to further investigation whether this indicates a widening of the Munni Munni Fault Zone or whether a cross fault has intersected the Munni Munni Fault Zone in this position.

Both drill holes intersected wide zones of Ag mineralisation. Drill hole 26WCDD035 intersected 48.5m @ 19 g/t Ag from 1.5m and 1m @ 12 g/t Ag from 72m. Drill hole 26WCDD036 intersected 67.1m @ 19g/t Ag from surface, 2m @ 15 g/t Ag from 72m and 1m @ 11 g/t Ag from 79m. These wide silver intersections to the west of the current MRE indicate the potential for growth west of the current MRE.

Figure 9. Cross section C-C' showing diamond drill holes 26WCDD035 and 26WCDD036. Example of westward low grade silver resource growth potential.

Cross Section D – D' with Diamond Drill Holes 26WCDD032 and 26WCDD033

Diamond drill holes 26WCDD032 and 26WCDD033 were targeted to test the east of and underneath the current MRE. The upper portion of drill hole 26WCDD033 intersected the current MRE to validate the MRE derived from RC drill holes on this section¹⁰ (**Figure 10**). Drill hole 26WCDD032 intersected mostly granite and gneiss with minor short intervals of ultramafic rock. Drill hole 26WCDD033 contained ultramafic rock to 28.8m and remained in granite and gneiss to the end of hole at 63.4m. The drill core was extremely fractured with several zones of completely broken and ground core from 68.4m to 94.28m in diamond drill hole 26WCDD032. This zone is characterised by intensely silicified granite and gneiss and contains massive quartz-carbonate veins between 85.2m and 90m.

Diamond drill hole 26WCDD033 contained extremely fractured and broken core from 26.7m to 63.4m. From 41.6m to 42.6m core was lost and the subsequent interval to 43.4m contained broken and ground-up fine-grained rock fragments and several clay zones. 26WCDD033 ended in broken rock due to the difficult ground conditions encountered in the drill hole. The zones of broken ground in both drill holes are interpreted to represent a fault. Further investigations are required to determine whether this broken zone is caused by the Munni Munni Fault Zone or whether a cross fault contributed to the wide zone.

Both drill holes intersected wide zones of silver mineralisation. Drill hole 26WCDD033 intersected 24m @ 14 g/t Ag from 35.5m. This intersection is outside the previously reported MRE¹⁰ (Figure 10) confirming that significant silver mineralisation is present outside the previous estimate. Further significant intersections of 8.8m @ 19 g/t Ag from 5m and 7.5m @ 19 g/t Ag from 23m are within the previous MRE and validate the silver mineralisation in the MRE.

Diamond drill hole 26WCDD032 contains significant intervals of 9m @ 15 g/t Ag from 44m, 1.14m @ 11 g/t Ag from 57.26m, 11.4m @ 15 g/t Ag from 72m and 1.14m @ 10 g/t Ag from 102.46m. All silver intersections in drill hole 26WCDD032 are outside the previously reported MRE (Figure 10).

Figure 10. Cross section D-D' showing diamond drill holes 26WCDD032 and 26WCDD033.

Cross Section E – E' with Diamond Drill Hole 26WCDD031

Diamond drill hole 26WCDD031 targeted the extension of the MMFZ to the north and underneath the MRE (Figure 11). The drill hole contained mostly unaltered granite and gneiss with minor short intervals of ultramafic rock. A minor fault was intersected between 41.4m and 45.9m characterised by extremely broken rock. The Munni Munni Fault Zone was intersected between 73.0m and 87.3m and contained extremely broken and intensely silicified granite and gneiss. Between 74.0m and 76.8m a breccia of granite clasts within a carbonate matrix was present and several quartz-carbonate veins were intersected between 87.3m and 103.2m.

Drill hole 26WCDD031 contained significant intersections of 1m @ 12g/t Ag from 49m and 5m @ 14g/t Ag from 79m. The latter intersection is associated with the Munni Munni Fault Zone.

Figure 11. Cross section E-E' showing diamond drill hole 26WCDD031.

Appendix 4: JORC Code, 2012 – Table 1 - Elizabeth Hill Diamond Drill Assay Results

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	- Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. - Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. - Aspects of the determination of mineralisation that are Material to the Public Report. - In cases where ‘industry standard’ work has been done this would be relatively simple (e.g. ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.	- Samples for laboratory analyses were taken by sawing the diamond drill (DD) core in half along a cutting line, which is offset from the core orientation line. The half of the drill core without the orientation line was collected for assaying. Duplicate samples were collected by sawing the remaining half core into two quarter cores, taking a quarter core for the assay and preserving the quarter core with the orientation line. Sample length was typically 1m but could be as high as 1.3m and as low as 20cm. The short sample lengths were designed to separately capture the zones of visible native silver mineralisation. Original and QAQC samples (CRM standards, blanks and core duplicates) were sent to the laboratory for analysis (ALS Perth for all elements and secondary assaying at ALS Langley Canada for any over grade Ag assays). - Entire DD samples were fine crushed (CRU-42a) to 90% passing 3.15mm. The sample was then rotary split directly from the crusher (SPL-22a) and pulverised to obtain 750g to 85% passing 75 µm (method PUL-25e). These preparation methods are industry standard and appropriate for the samples
Drilling techniques	Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	- Holes were drilled predominantly on a westerly and easterly azimuths, all with a moderate approximately 60° dip to varying depths. - Drilling was undertaken with a Hyundai ECR-18 track mounted diamond core drill rig capable of drilling HQ core to 600m. Core was recovered in a triple tube. All the core in this program was drilled HQ3. - The drill rig was lined up on the proposed dip and azimuth by the drillers using an Azimuth Aligner instrument. - Core was orientated using Reflex ACT III HQ tool. - Drill hole collars were surveyed using an IMDEX TN14 Gyro and Differential GPS. - An Axis North seeking gyro tool was used for downhole surveying of the drill holes and was calibrated prior to use, with readings taken at approximately every 5m on the in and out run.
Drill sample recovery	- Method of recording and assessing core and chip sample recoveries and results assessed. - Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to	- Core recovery was systematically recorded from the commencement of diamond coring to the end of hole, by reconciling against driller depth blocks, production plods and knowledge obtained from visual inspection. - Core recoveries typically averaged above 84% with isolated minor zones of lesser recovery.

ASX: WCE ANNOUNCEMENT

13 August 2026

Criteria	JORC Code explanation	Commentary
	preferential loss/gain of fine/coarse material.	- No relationship has been established between core recovery and grade. There is no reason to expect any sampling bias. - Any lost recovery intervals have been treated as not containing Ag grades and, therefore, reported composite intersection grades represent minimum average grades. - Detailed core recovery data was noted throughout the drilling by the drilling crew and confirmatory measurements were collected and recorded by the geologist as part of the geotechnical logging.
Logging	- Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. - Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. - The total length and percentage of the relevant intersections logged.	- Diamond drill core was orientated and geologically and geotechnically logged for the entire drill hole by an experienced team of geologists with the data stored in a database. - All core logging was both qualitative and quantitative in nature. - Photographs are taken prior to the cutting and sampling of the core; core is wetted to improve the visibility of features in the photographs.
Subsampling techniques and sample preparation	- If core, whether cut or sawn and whether quarter, half or all core taken. - If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. - For all sample types, the nature, quality and appropriateness of the sample preparation technique. - Quality control procedures adopted for all subsampling stages to maximise representivity of samples. - Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. - Whether sample sizes are appropriate to the grain size of the material being sampled.	- Samples for laboratory analyses were taken by sawing the DD core in half along a cutting line, which is offset from the core orientation line. The half of the drill core without the orientation line was collected for assaying. Duplicate samples were collected by sawing the remaining half core into two quarter cores, taking a quarter core but preserving the quarter core with the orientation line. Original and QAQC samples (CRM standards, blanks and core duplicates) were sent to the laboratory for analysis (ALS Perth for all elements and secondary assaying at ALS Langley Canada for any over grade Ag assays). - Entire DD core samples were fine crushed (CRU-42a) to 90% passing 3.15mm. The sample was then rotary split directly from the crusher (SPL-22a) and pulverised to obtain 750g to 85% passing 75 µm (method PUL-25e). These preparation methods are standard and appropriate for the samples. - The 1m half core samples are appropriate to the grain size of the material being sampled. Where intervals of native silver were logged, these were sampled to mineralogical boundaries as low as 0.2m in length
Quality of assay data and laboratory tests	- The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. - For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. - Nature of quality control procedures adopted (e.g., standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e., lack of bias) and precision have been established.	- Laboratory samples were analysed at ALS laboratories (Perth) for 48 elements, four acid digestion and ICP-MS finish. Samples with above upper detection limit analyses (>100g/t Ag) were then analysed at ALS Perth with Ag-OG62 (four acid, ore grade Ag), ME-OG62 (four acid ore grade elements), Pb-OG62 (ore grade Pb – four acid) and Zn-OG62 (ore grade Zn – four acid). For Ag assays >1,500g/t Ag, samples were sent to ALS Langley (Canada) for analysis by Ag-GRA21 (Ag 30g FA-GRAV finish). For Ag assays >10,000g/t, samples were then further analysed at ALS Langley by Ag-CON01 (Ag concentrate). - Four acid digestion is considered a near total digestion. - The first samples analysed at the start of each hole were a blank then a standard before assaying of core samples, then ending the sample run for the hole with a standard then a blank.

ASX: WCE ANNOUNCEMENT

13 August 2026

Criteria	JORC Code explanation	Commentary
		- Certified reference material (CRM) standards (OREAS 303b, OREAS-602c, OREAS-608b, OREAS-611b) were inserted in the sampling stream as every 25th sample. Duplicate samples (quarter core) were collected as every 50th sample. Irrespective of where intervals of native silver were sampled in the hole, a duplicate sample was collected which was followed by insertion of a blank. - Acceptable levels of accuracy and precision have been established for all CRM standards and for the majority of the blank material. - One blank which had been inserted after core intervals with visible native silver showed some contamination of the blanks from the previous extremely high-grade Ag sample of <1% relative as carry-over from the crusher and pulveriser. The Competent Person (CP) considers the levels of carry-over is acceptable and there was no direct evidence of further contamination after the blank on succeeding samples
Verification of sampling and assaying	- The verification of significant intersections by either independent or alternative company personnel. - The use of twinned holes. - Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. - Discuss any adjustment to assay data.	- Significant silver intercepts reported in this announcement were generated by ERM's Principal Structural Geologist and QAQC cross checking and validation completed by the CP. - The diamond drilling twinned several historical drill holes to verify their reported grades. - Primary data have been entered into spreadsheets on laptops which then have been verified and entered into the database. - No adjustments were made to the assay data.
Location of data points	- Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. - Specification of the grid system used. - Quality and adequacy of topographic control.	- A Mineral Resource or Ore Reserve is not being reported. - Diamond drill holes are located using a Differential GPS (DGPS) with accuracy +/- 0.35m for northing and easting and 0.25m for RL. Historical collars have been surveyed by DGPS where collars were found. 2026 drilling uses a downhole north seeking gyro for surveys that provides continuous readings in and out of the drill hole. The data is uploaded into a database for storage. - A 0.5m DTM is used for topographic control. - Data has been collected in GDA94/MGA Zone 50 and converted to GDA2020/MGA Zone 50.
Data spacing and distribution	- Data spacing for reporting of Exploration Results. - Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. - Whether sample compositing has been applied.	- No Mineral Resource or Ore Reserve are reported. - Drill holes were either designed to verify historical drill results and/or test for extensions of mineralisation. - Core samples for laboratory analyses have been taken through the zone interpreted to potentially contain mineralisation in the drill hole on a 1m sample length but may be reduced to 0.2m or extended to 1.3m where geological or mineralogical parameters required.
Orientation of data in relation to geological structure	- Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. - If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this	- This hole orientation was designed to drill from east to west or west to east at moderate dip to intersect the north-south trending, sub-vertical, mineralised structural envelope as close to perpendicular. Geologically described logged intersections do not represent true thickness. - The drill orientation is not expected to have introduced any sampling bias.

ASX: WCE ANNOUNCEMENT

13 August 2026

Criteria	JORC Code explanation	Commentary
	should be assessed and reported if material.	
Sample security	The measures taken to ensure sample security.	- Drill core was transported from the drill rig to the storage facility in Karratha by WCE personnel. - Samples have been stored in a secured yard in Karratha under supervision by WCE personnel. - Diamond core samples were collected in individual calico bags and several calico bags were then placed in labelled polyweave bags that were zip locked. Polyweave bags were subsequently loaded into labelled bulka bags that were tied off and secured for transportation. - A chain of control was utilised for tracking of samples from Karratha to the lab in Perth. - Samples were dispatched to the ALS laboratory in Perth via a commercial transport company
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	No audits or reviews of the sampling techniques has been undertaken by West Coast Silver or any independent parties. The data has been audited by ERM's Database Manager before entering into the database. The Database Manager also completed an audit of the QAQC samples.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	- Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. - The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	- The results reported in this announcement refer to RC and Diamond drill holes drilled on M47/342. - The tenements lie within the Ngarluma Native Title claim. - The tenements are in good standing with no known impediments.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	- The Elizabeth Hill deposit and adjoining area has been explored for Ni, Cu, PGM, base metals, Li and Ag mineralisation since 1968 when US Steel International Inc explored the area for base metals and nickel. - Massive silver was discovered in ~1994-1995 by Legend mining NL in a percussion hole drilling program. Further drilling followed and in 1997 and exploration shaft and drive was sunk by East Coast Minerals NL. - Underground mining at Elizabeth Hill was conducted in 1999-2000 with additional drilling completed by East Coast Minerals NL until the project was sold to Global Strategic Metals NL in 2012. Alien Metals Ltd purchased lease M47/342 in early 2020. - Considerable exploration for Ni, Cu, PGM was conducted by Hunter Resources dating back to the 1980s. - Helix Resources acquired the Munni Munni Project in the late 1990's and undertook a number of scoping studies.

ASX: WCE ANNOUNCEMENT

13 August 2026

Criteria	JORC Code explanation	Commentary
		- In 2002 a SRK Mineral Resource estimate for PGE and Au was published in accordance with the JORC code. - Subsequently, Platina Resources undertook mining studies and two scoping studies for the PGE and Au mineralisation. - West Coast Silver Limited has completed three drilling programs.
Geology	Deposit type, geological setting and style of mineralisation.	The Elizabeth Hills silver mineralisation is structurally controlled and is located on the eastern boundary of the north-south trending Munni Munni Fault. Mineralisation has been intersected over a 100m north-south zone along the boundary of the Munni Munni Fault, plunging south along the granite contact. The zone has an east-west width of 15-20m with the high-grade core restricted to around 3m width in the region of the underground workings. The mineralised zone is separated into several pods and occurs within a quartz carbonate chalcedonic silica breccia that shows veining. The silver occurs in fine disseminations, needles, veins, nuggets and platelets up to several centimetres in diameter.
Drill hole Information	- A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: - o easting and northing of the drill hole collar - o elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar - o dip and azimuth of the hole - o down hole length and interception depth - o hole length. - If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case	Drill information relevant to this announcement has been provided above in the Appendices.
Data aggregation methods	- In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g., cutting of high grades) and cut-off grades are usually Material and should be stated. - Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. - The assumptions used for any reporting of metal equivalent values should be clearly stated	- Significant drill intersections for the drilling reported in Tables 1 to 4 in this announcement have been calculated using a 10g/t and 20g/t Ag cut-off, are length weighted, and may include up to 2m of internal dilution. Pb and Ni intersections represent all values above background levels greater than 1,000ppm for Pb and 2,000ppm for Ni. 2025 and historical drilling composite intersections have been calculated using a 25g/t cut-off for Ag reflecting the near mine environment. 2025 or historical drilling assay data, geochemical data, and geophysical data referenced have previously been reported. - No metal equivalents are being reported.
Relationship between mineralisation widths and intercept lengths	- These relationships are particularly important in the reporting of Exploration Results. - If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. - If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g., 'down hole length, true width not known').	Drill hole intersections are not true widths due to the sub vertical geometry of the mineralised body and -60° dip of the RC and diamond drill holes.

ASX: WCE ANNOUNCEMENT

13 August 2026

Criteria	JORC Code explanation	Commentary
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Appropriate maps and figures have been included in the body of this announcement and Appendix 1.
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results	- All relevant and material exploration data to highlight the target areas discussed have been reported or referenced. - All drill assay information relevant to this announcement has been provided above in the body of the announcement and in the Appendices. Five elements (Ag, Cu, Ni, Pb, Zn) have been reported only in the Appendices, as they are deemed to be spatially associated with silver mineralisation. Additional elements analysed are not considered relevant. - Any historical drill data referenced in this announcement has been previously reported.
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	All relevant and material exploration data for the areas discussed have been reported or referenced.
Further work	- The nature and scale of planned further work (e.g., tests for lateral extensions or depth extensions or large-scale step-out drilling). - Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	- Further work may include but is not limited to systematic geological mapping, channel and rock chip sampling, soil sampling, pXRF analysis and mineral identification, geophysics, structural interpretation, historical data compilation, and drilling to identify suitable host rock geology and structural architecture for polymetallic mineralisation. - Diagrams are included in the body of the announcement and Appendix 1.
